# Background

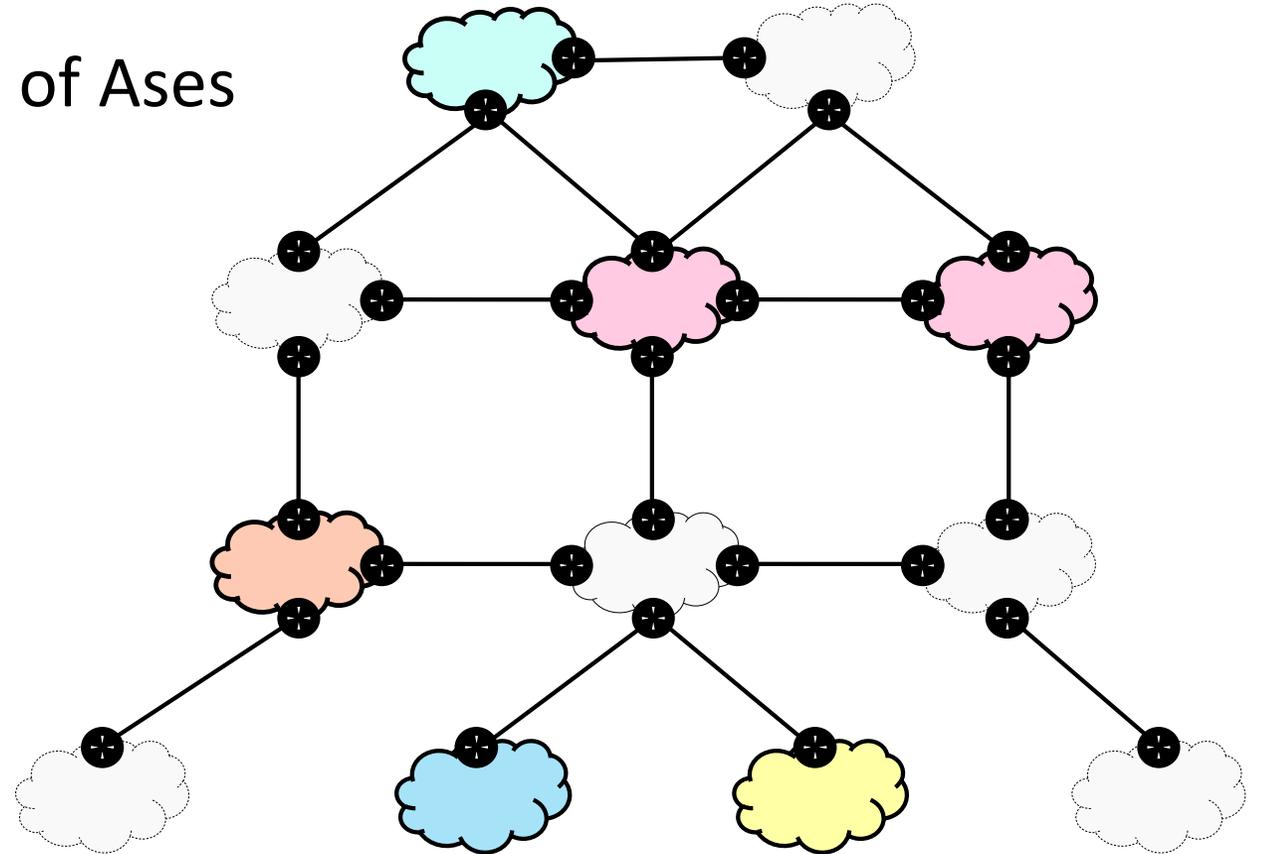

# The Internet

- Autonomous Systems (ASes) are independent networks

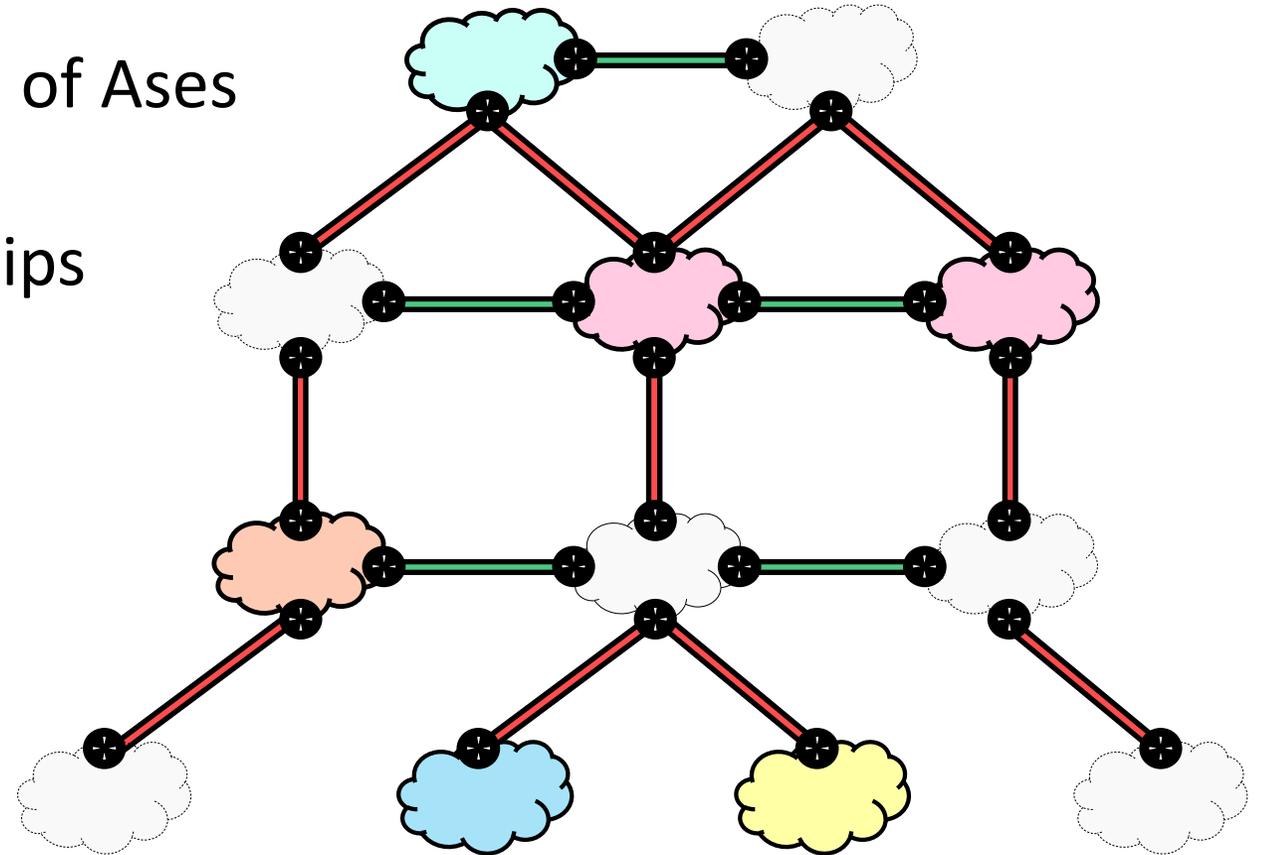

# The Internet

- Autonomous Systems (ASes) are independent networks
- The Internet is an Interconnection of ASES

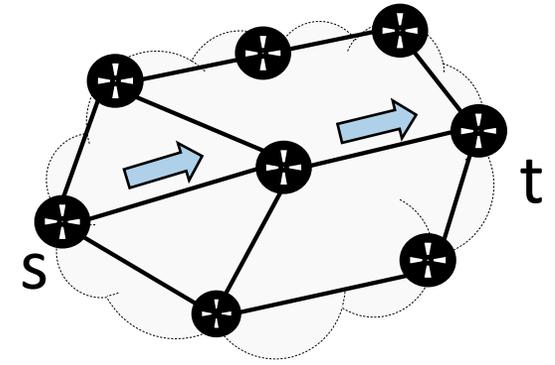

# The Internet

- Autonomous Systems (ASes) are independent networks
- The Internet is an Interconnection of ASES
- ASes establish business relationships
  - Customer-to-provider \$\$\$
  - Peer-to-Peer Free

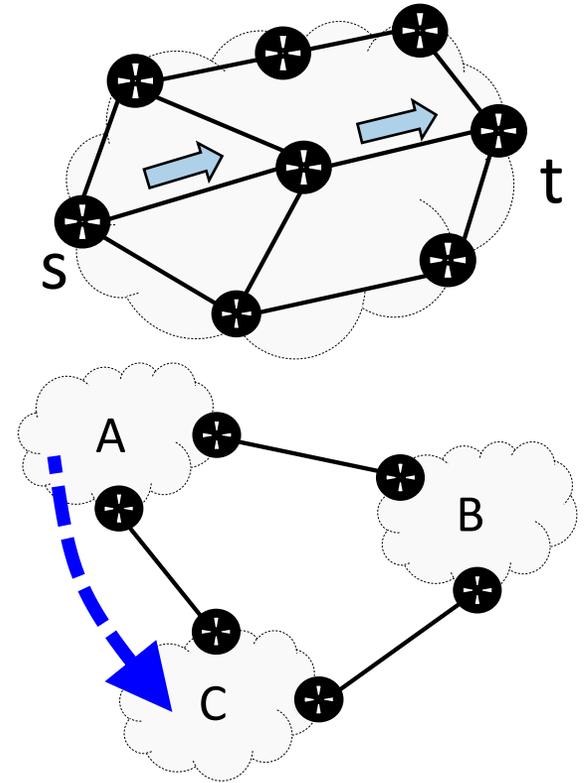

# The Internet

- ASes run an Internal Gateway Protocol (IGP)
  - Deals with intra-domain routing

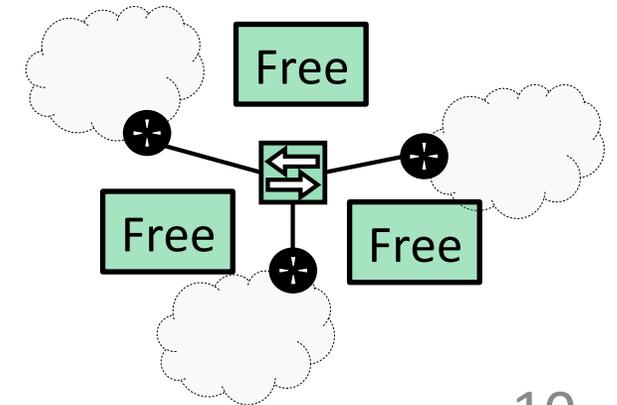

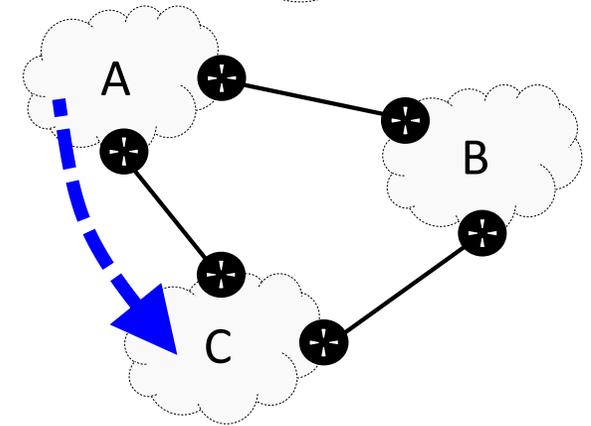

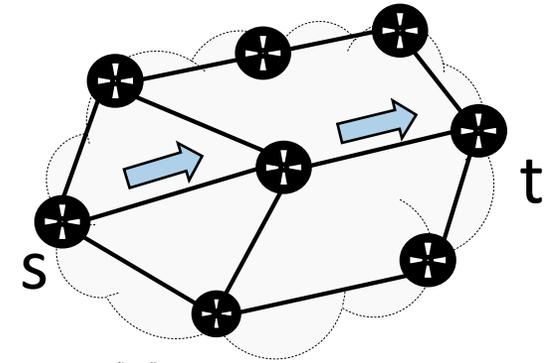

# The Internet

- ASes run an Internal Gateway Protocol (IGP)
  - Deals with intra-domain routing
- ASes run the Border Gateway Protocol (BGP)
  - Deals with the inter-domain routing

# The Internet

- ASes run an Internal Gateway Protocol (IGP)
  - Deals with intra-domain routing
- ASes run the Border Gateway Protocol (BGP)
  - Deals with the inter-domain routing
- ASes peer at Internet Exchange Points (IXPs)
  - Peer-to-peer relationships at a large scale

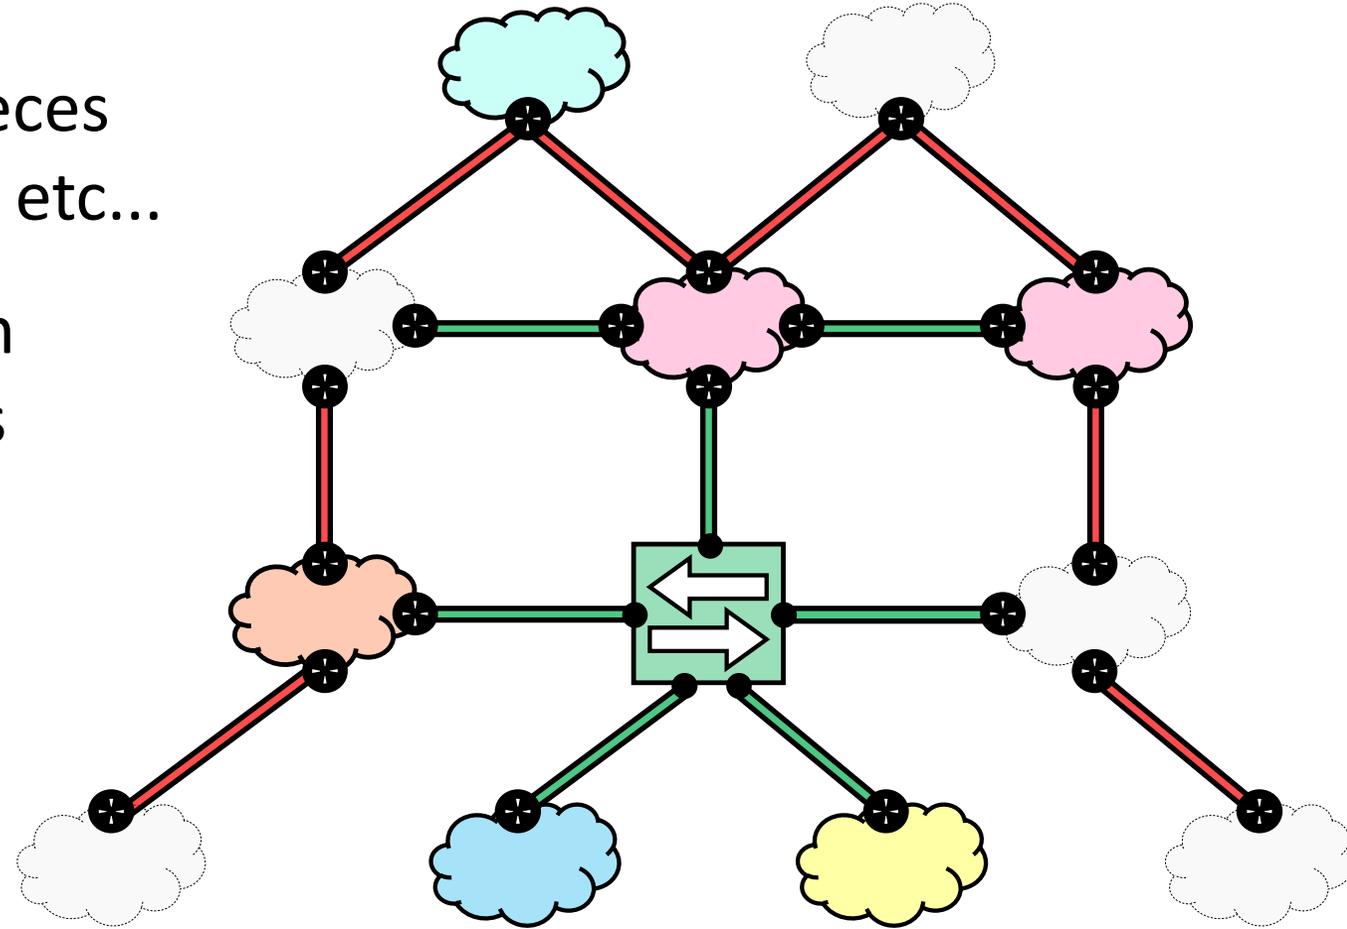

# Research Goal

# Research Goal

- Any system may have broken pieces
  - Problems, errors, limitations, etc...

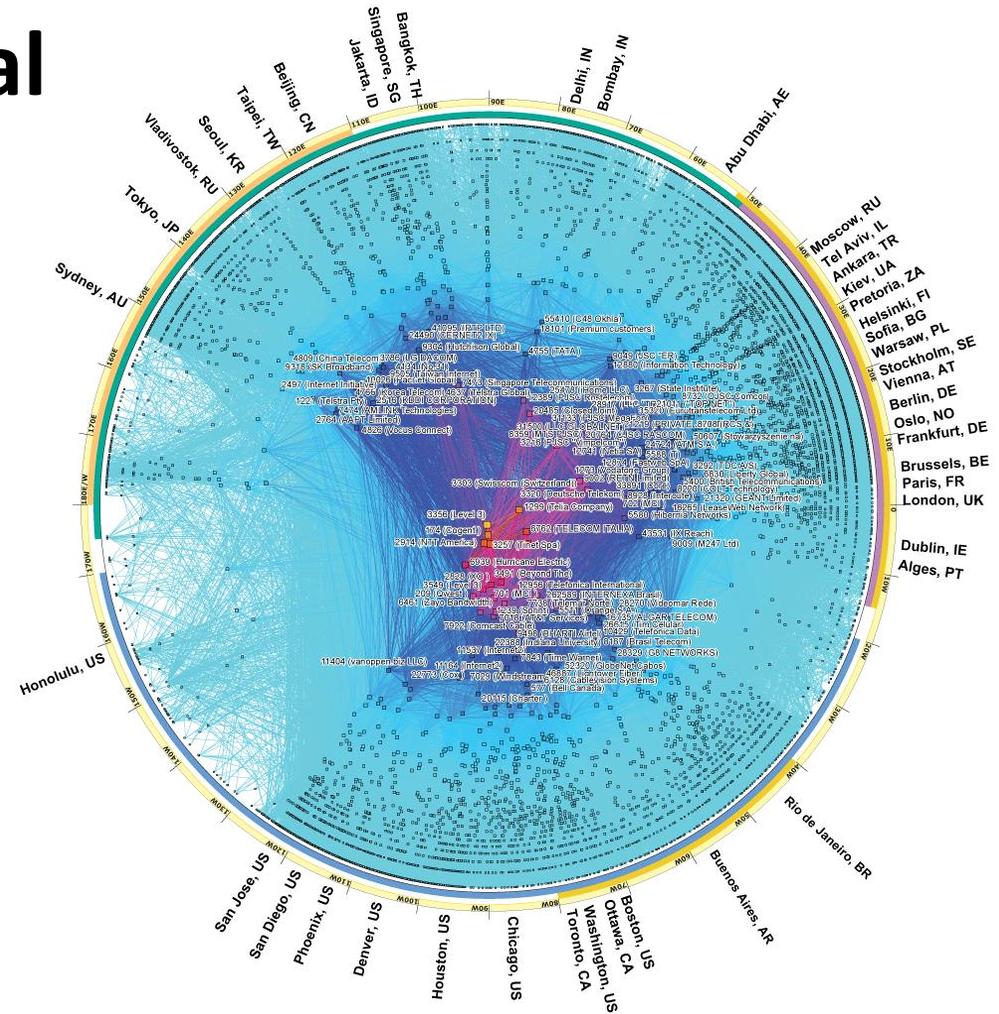

# Research Goal

- Any system may have broken pieces
  - Problems, errors, limitations, etc...
- The Internet is a complex system
  - Protocols, facilities, networks
  - Hardware, software
  - Network operators

# Research Goal

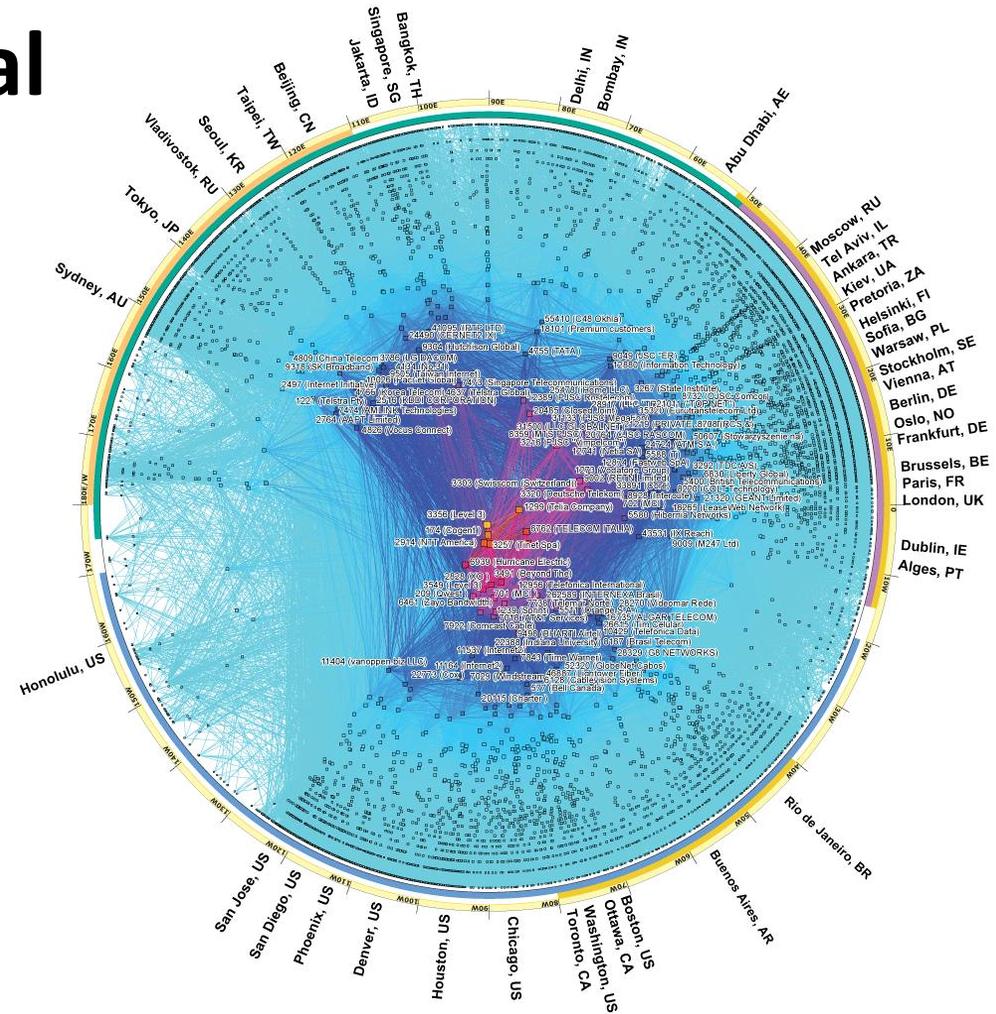

- Any system may have broken pieces
  - Problems, errors, limitations, etc...
- The Internet is a complex system
  - Protocols, facilities, networks
  - Hardware, software
  - Network operators
- The Internet is “big”...
  - Composed of 70K ASes
  - Point of observation matters

CAIDA's IPv4 AS Core February 2017

**Research Goal: Detecting Hidden Broken Pieces of The Internet**

# Research Questions

# Research Questions

Q1: Can we detect BGP lies?

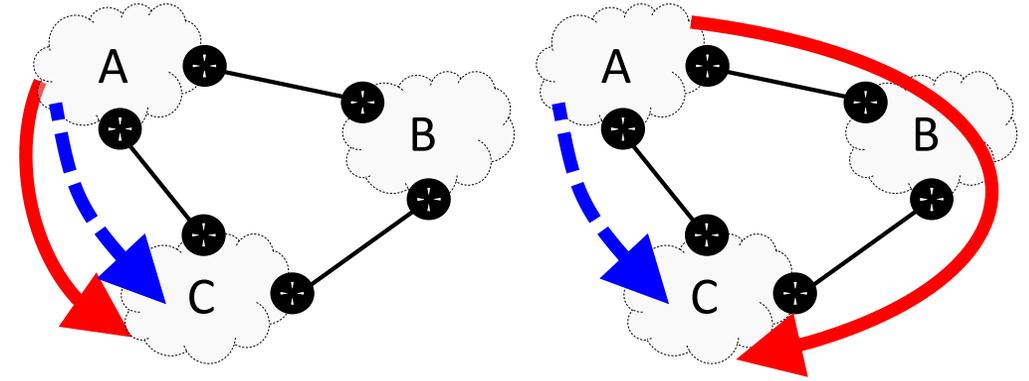

- Expected  $\neq$  Practice

# Research Questions

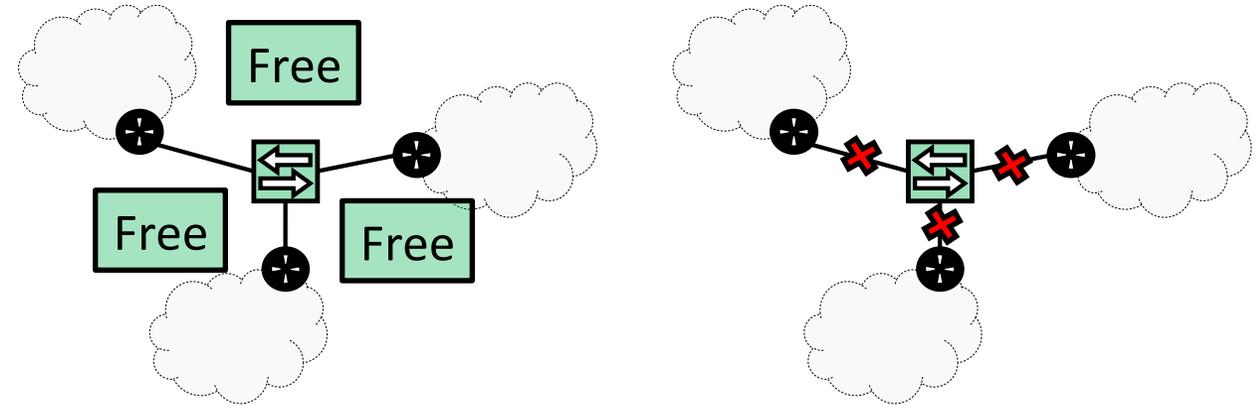

Q1: Can we detect BGP lies?

- Expected  $\neq$  Practice

Q2: Are there failed IXPs? Why?

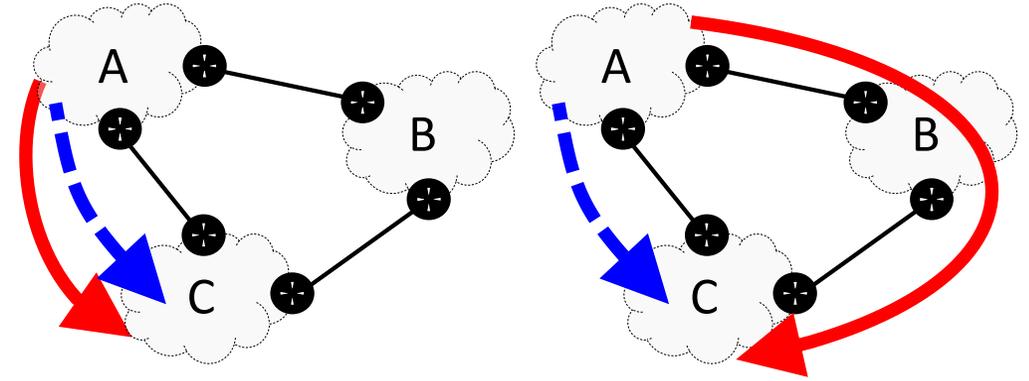

- IXPs with low coverage

# Research Questions

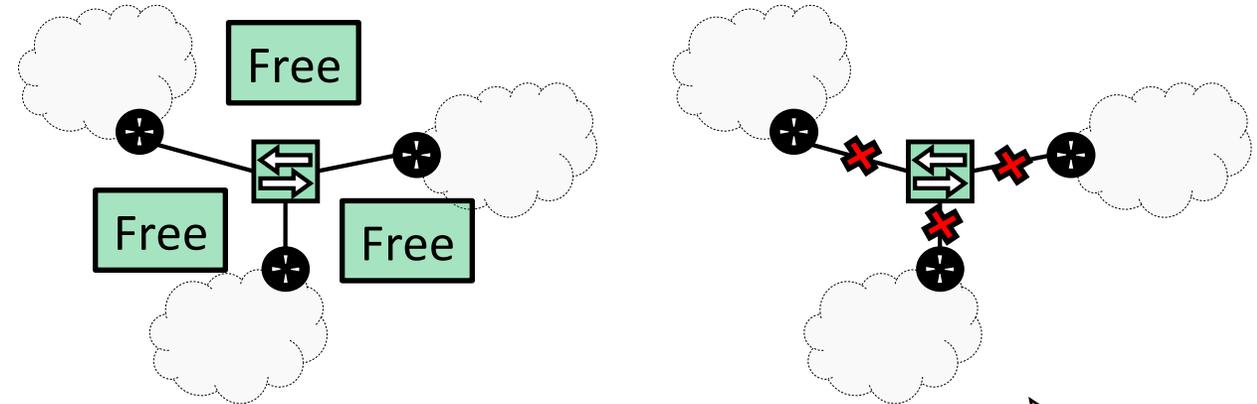

Q1: Can we detect BGP lies?

- Expected  $\neq$  Practice

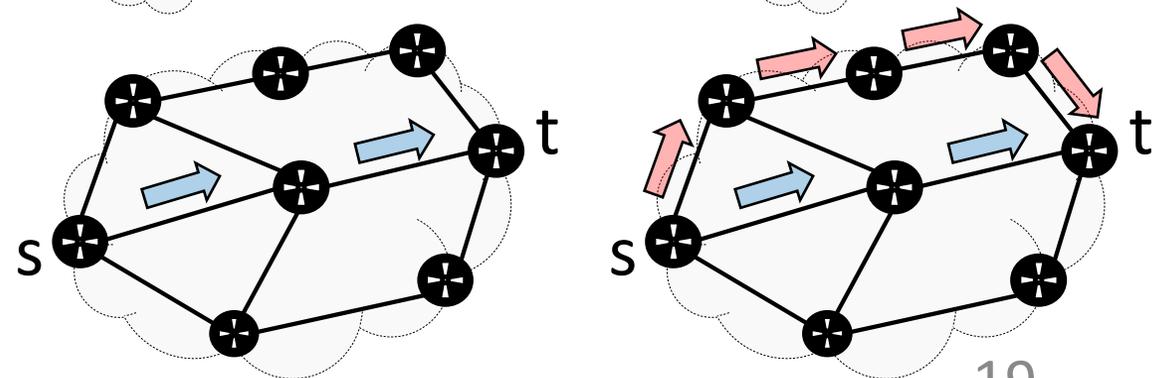

Q2: Are there failed IXPs? Why?

- IXPs with low coverage

Q3: Can we model and detect detours?

- Expected  $\neq$  Practice

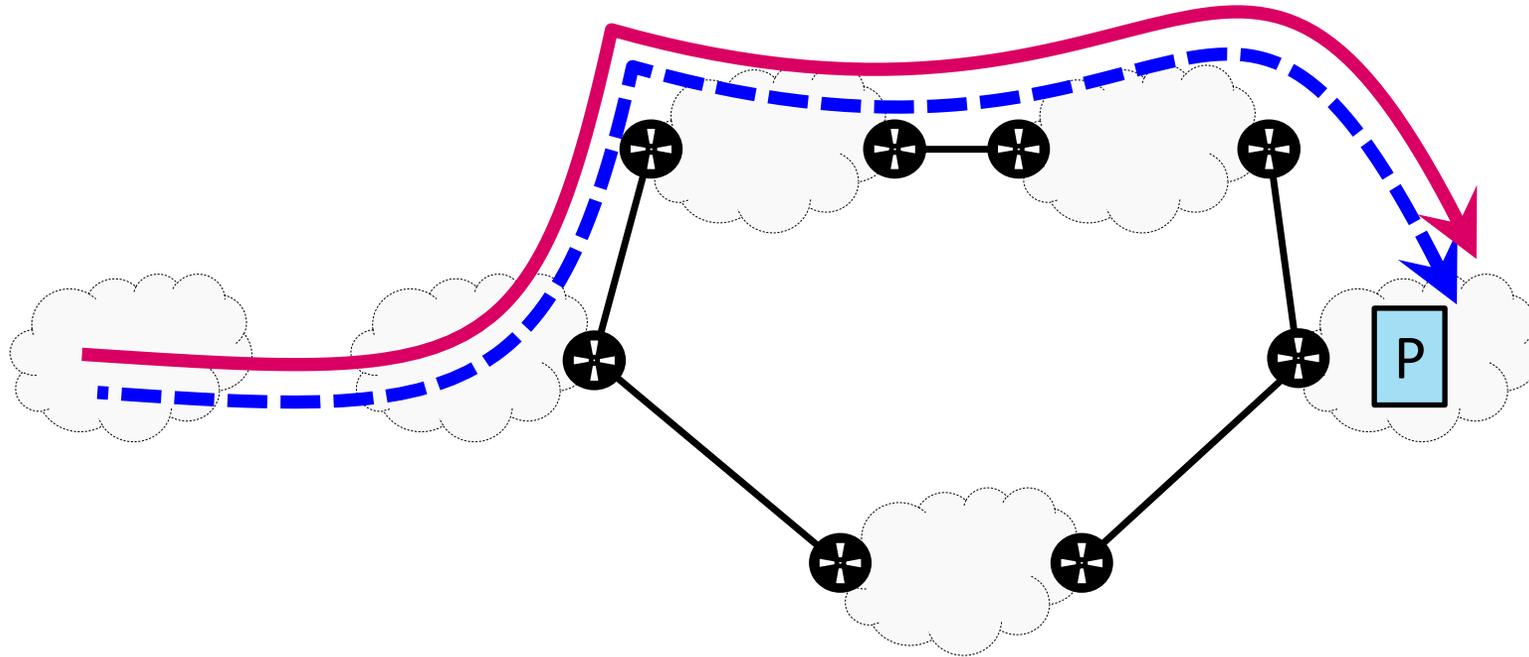

# Outline

- Background, Research Goal and Questions
- **Part I. Filtering the noise to reveal BGP lies**
- Part II. Success and Failure of IXPs in Latin America
- Part III. The Art of Detecting Forwarding Detours
- Conclusions and Future Work

# Background

# Border Gateway Protocol (BGP)

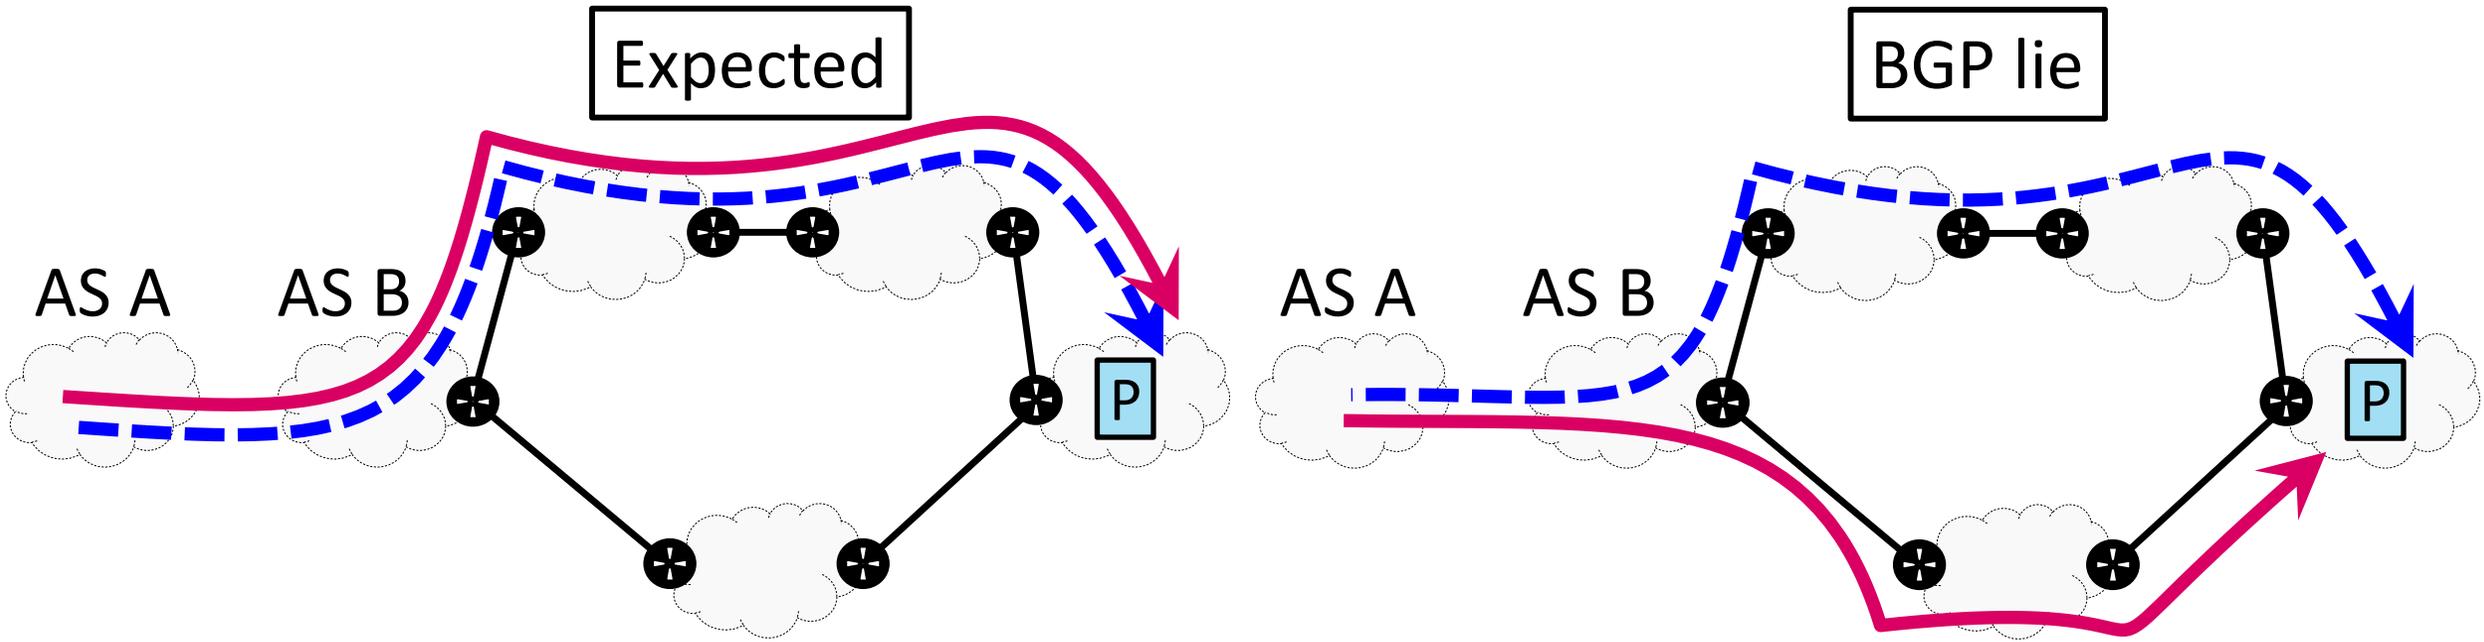

- For each external prefix **P**...
  - The **control path (CP)** that should **theoretically** be followed
  - The **data path (DP)** is the path used in **practice**

# **Problem Statement**

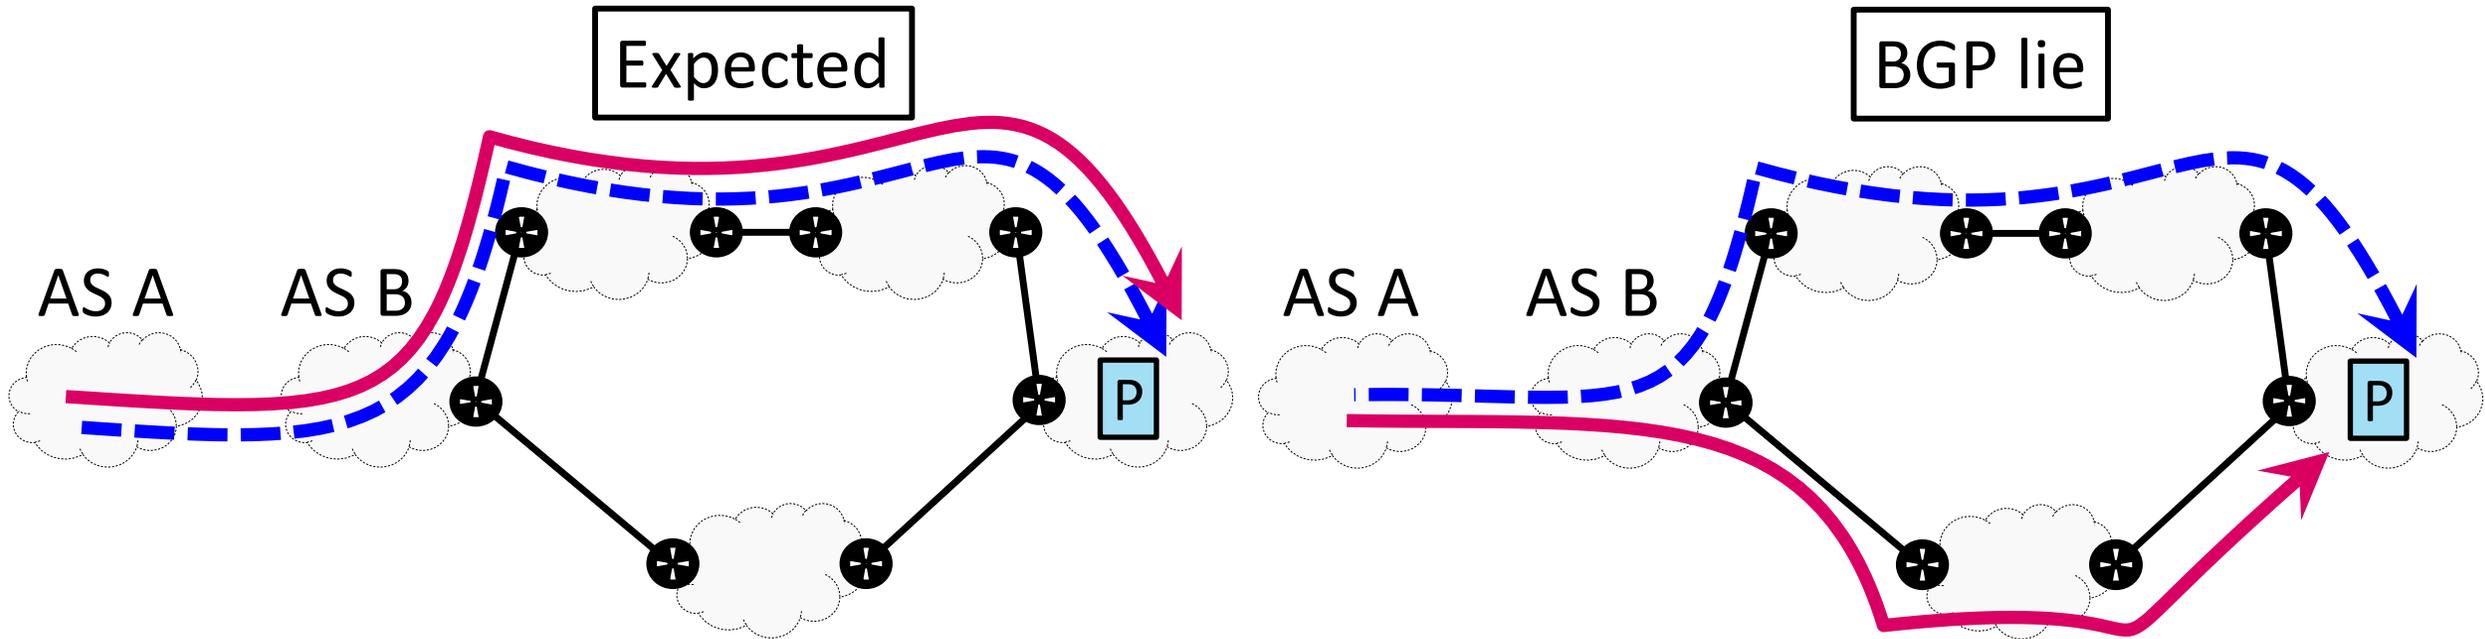

# What are BGP lies?

When the **control path (CP)** and **data path (DP)** for a prefix **P** do not match

# What are BGP lies?

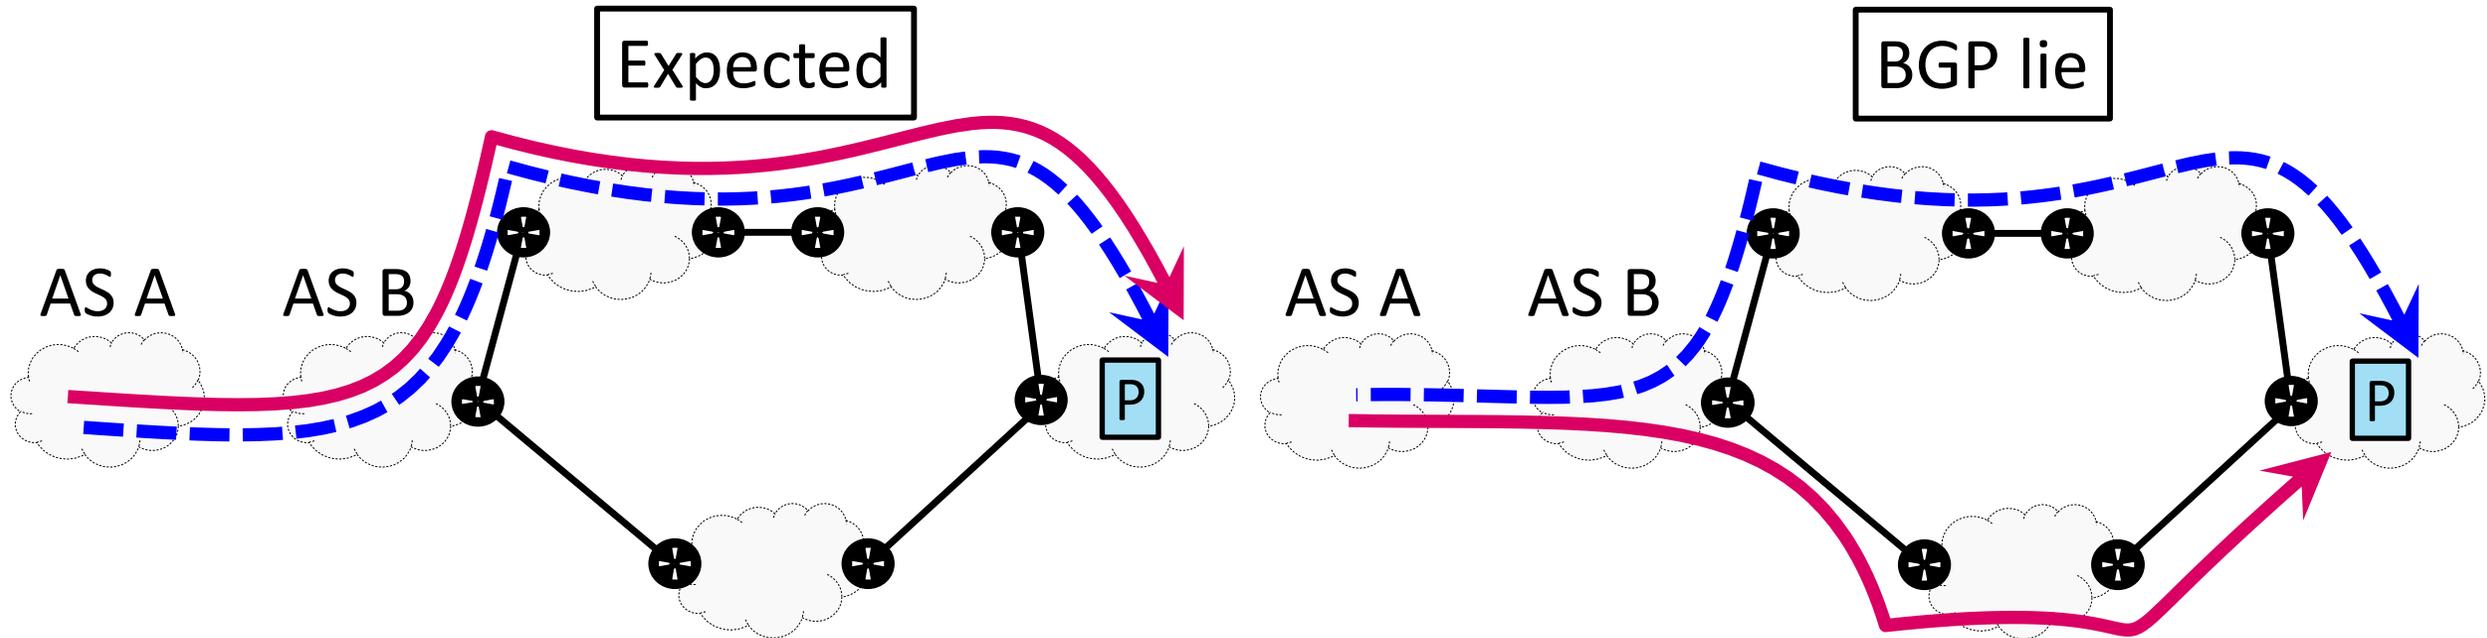

When the **control path (CP)** and **data path (DP)** for a prefix **P** do not match

AS B is lying to AS A

# What are BGP lies?

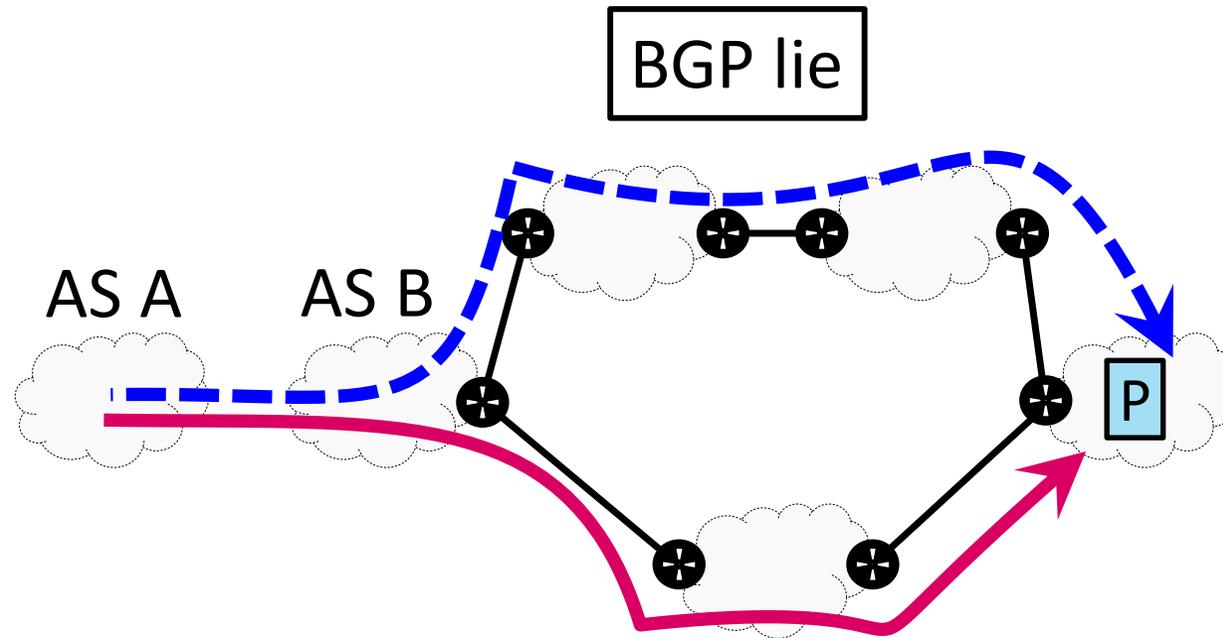

When the **control path (CP)** and **data path (DP)** for a prefix **P** do not match

AS B is lying to AS A

BGP lies may result from **malicious behavior** or **technical limitations**

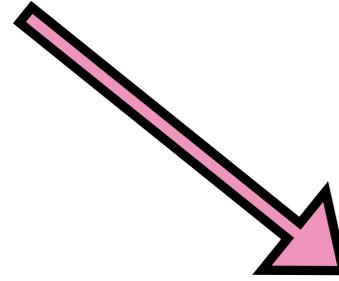

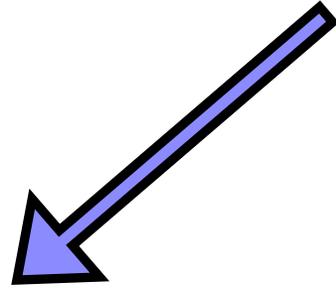

# Why detecting BGP lies (CP $\neq$ DP)?

- If not, what is the point of using BGP?
- Allows to detect possible malicious ASes
- Would allow to troubleshoot ASes

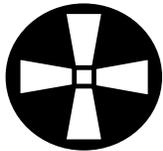

# **Detecting BGP lies**

# Required data

Control paths

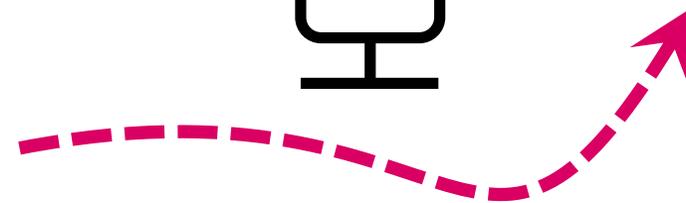

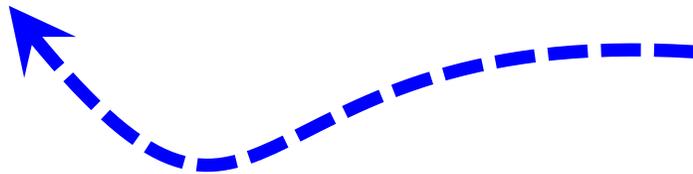

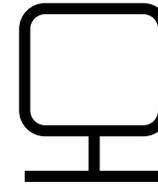

Data paths

P	CP
P <sub>Y</sub>	BCD
P <sub>R</sub>	D
P <sub>V</sub>	E

Vantage Point (VP)

Traceroute per destination

# Technical Considerations

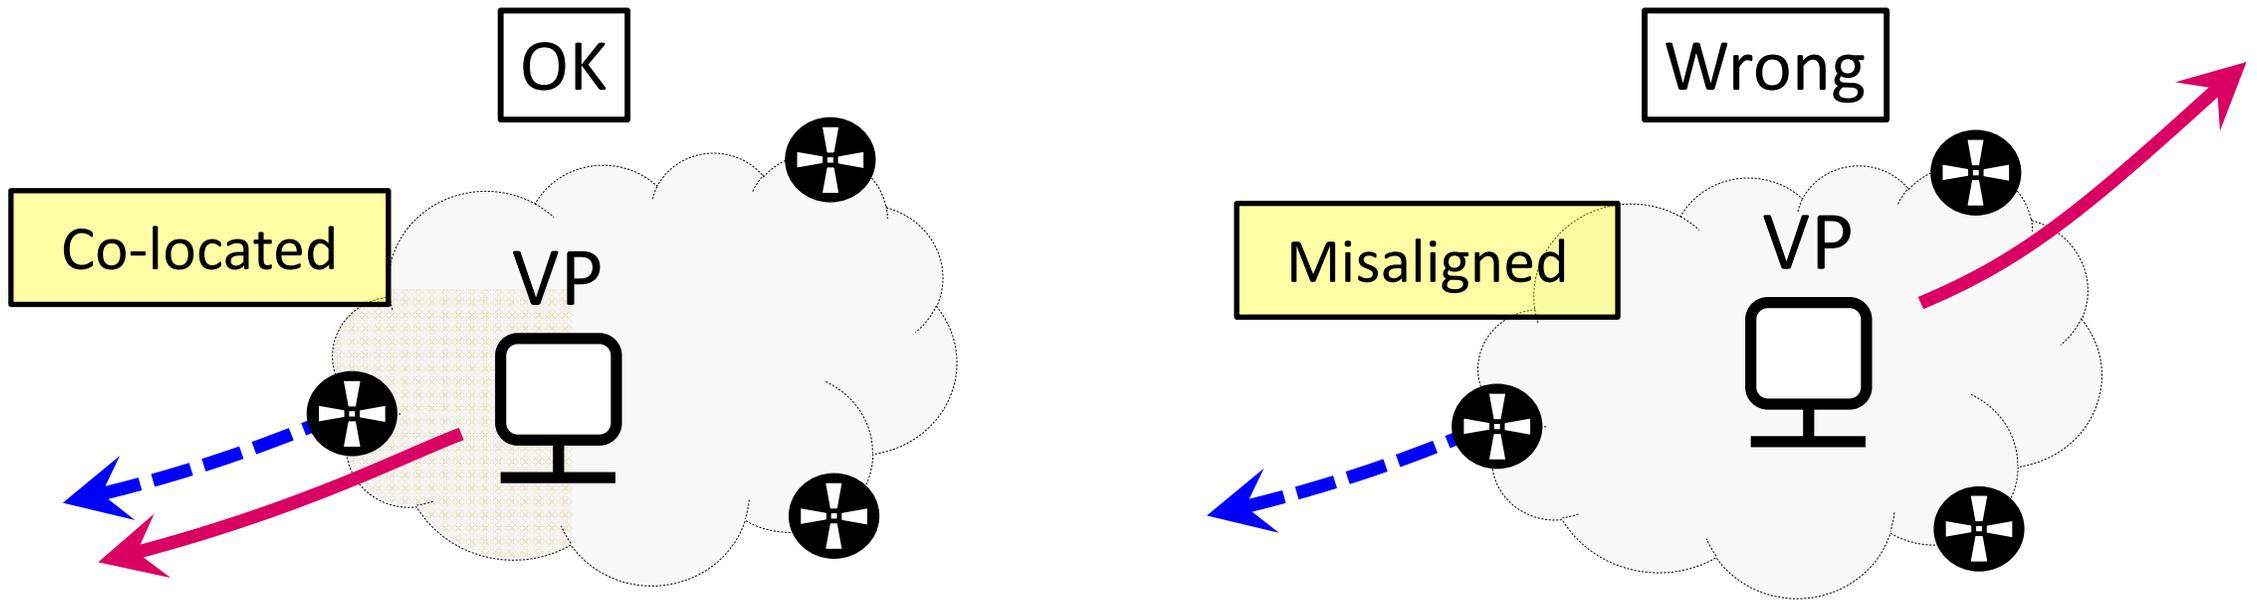

- Space-synchronization
  - Measurement platform
- Address space and time synchronization
  - Which DP should be compared with which CP
- IP-to-AS mapping
  - CPs come as AS-paths but DPs as IP-paths

# Technical Considerations

- Space-synchronization
  - Measurement platform
- Address space and time synchronization
  - Which DP should be compared with which CP
- IP-to-AS mapping
  - CPs come as AS-paths but DPs as IP-paths

# Space-synchronization

- **Control paths** are obtained from a given router
- **Data paths** are gathered from a VP
- To be comparable, **DPs** need to go through the router that shared the **CPs**

# IP-to-AS mapping

- While CPs are AS-paths, DPs are obtained as IP-paths

CP: AS A, AS B, AS C...

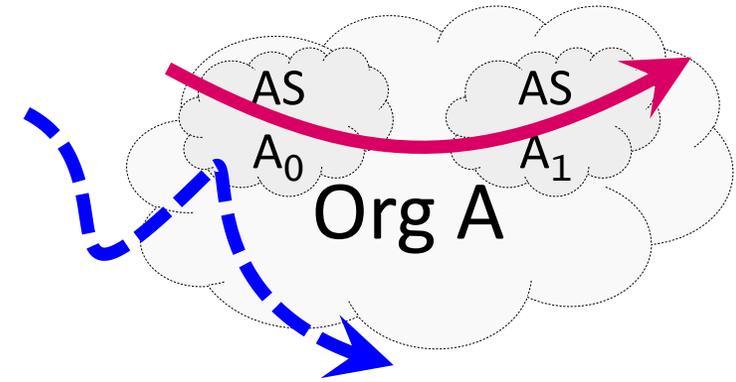

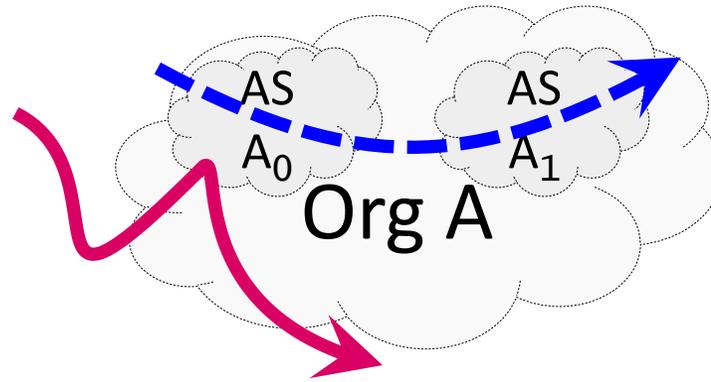

DP: IP1, IP2, IP3, IP4...

**To compare them, an IP-to-AS mapping tool is needed !**

# **The problem of IP-to-AS mapping**

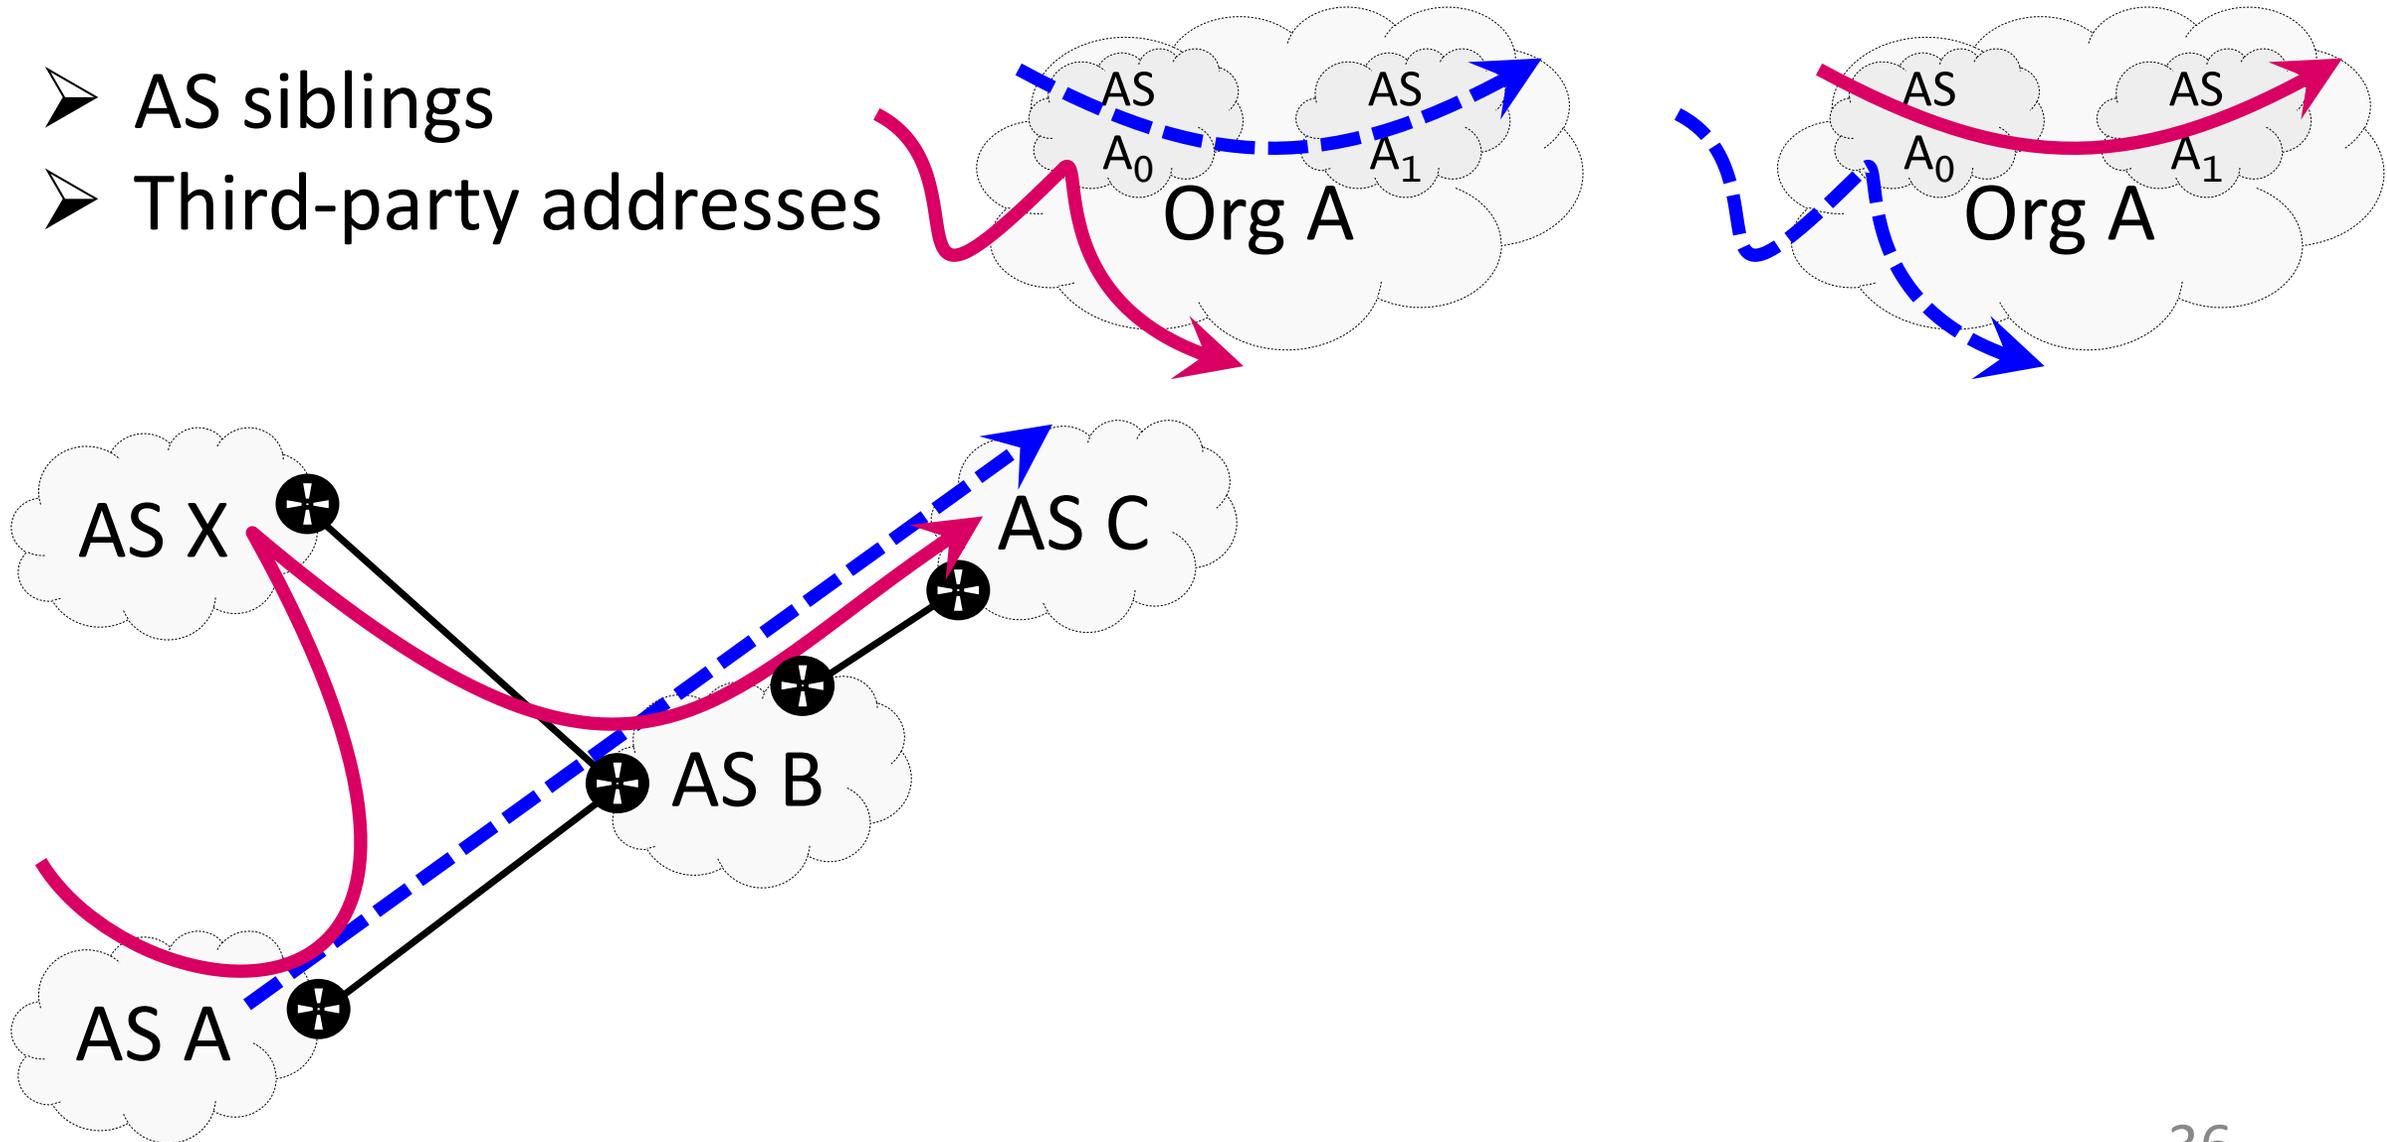

# Noise or sources of errors

➤ AS siblings

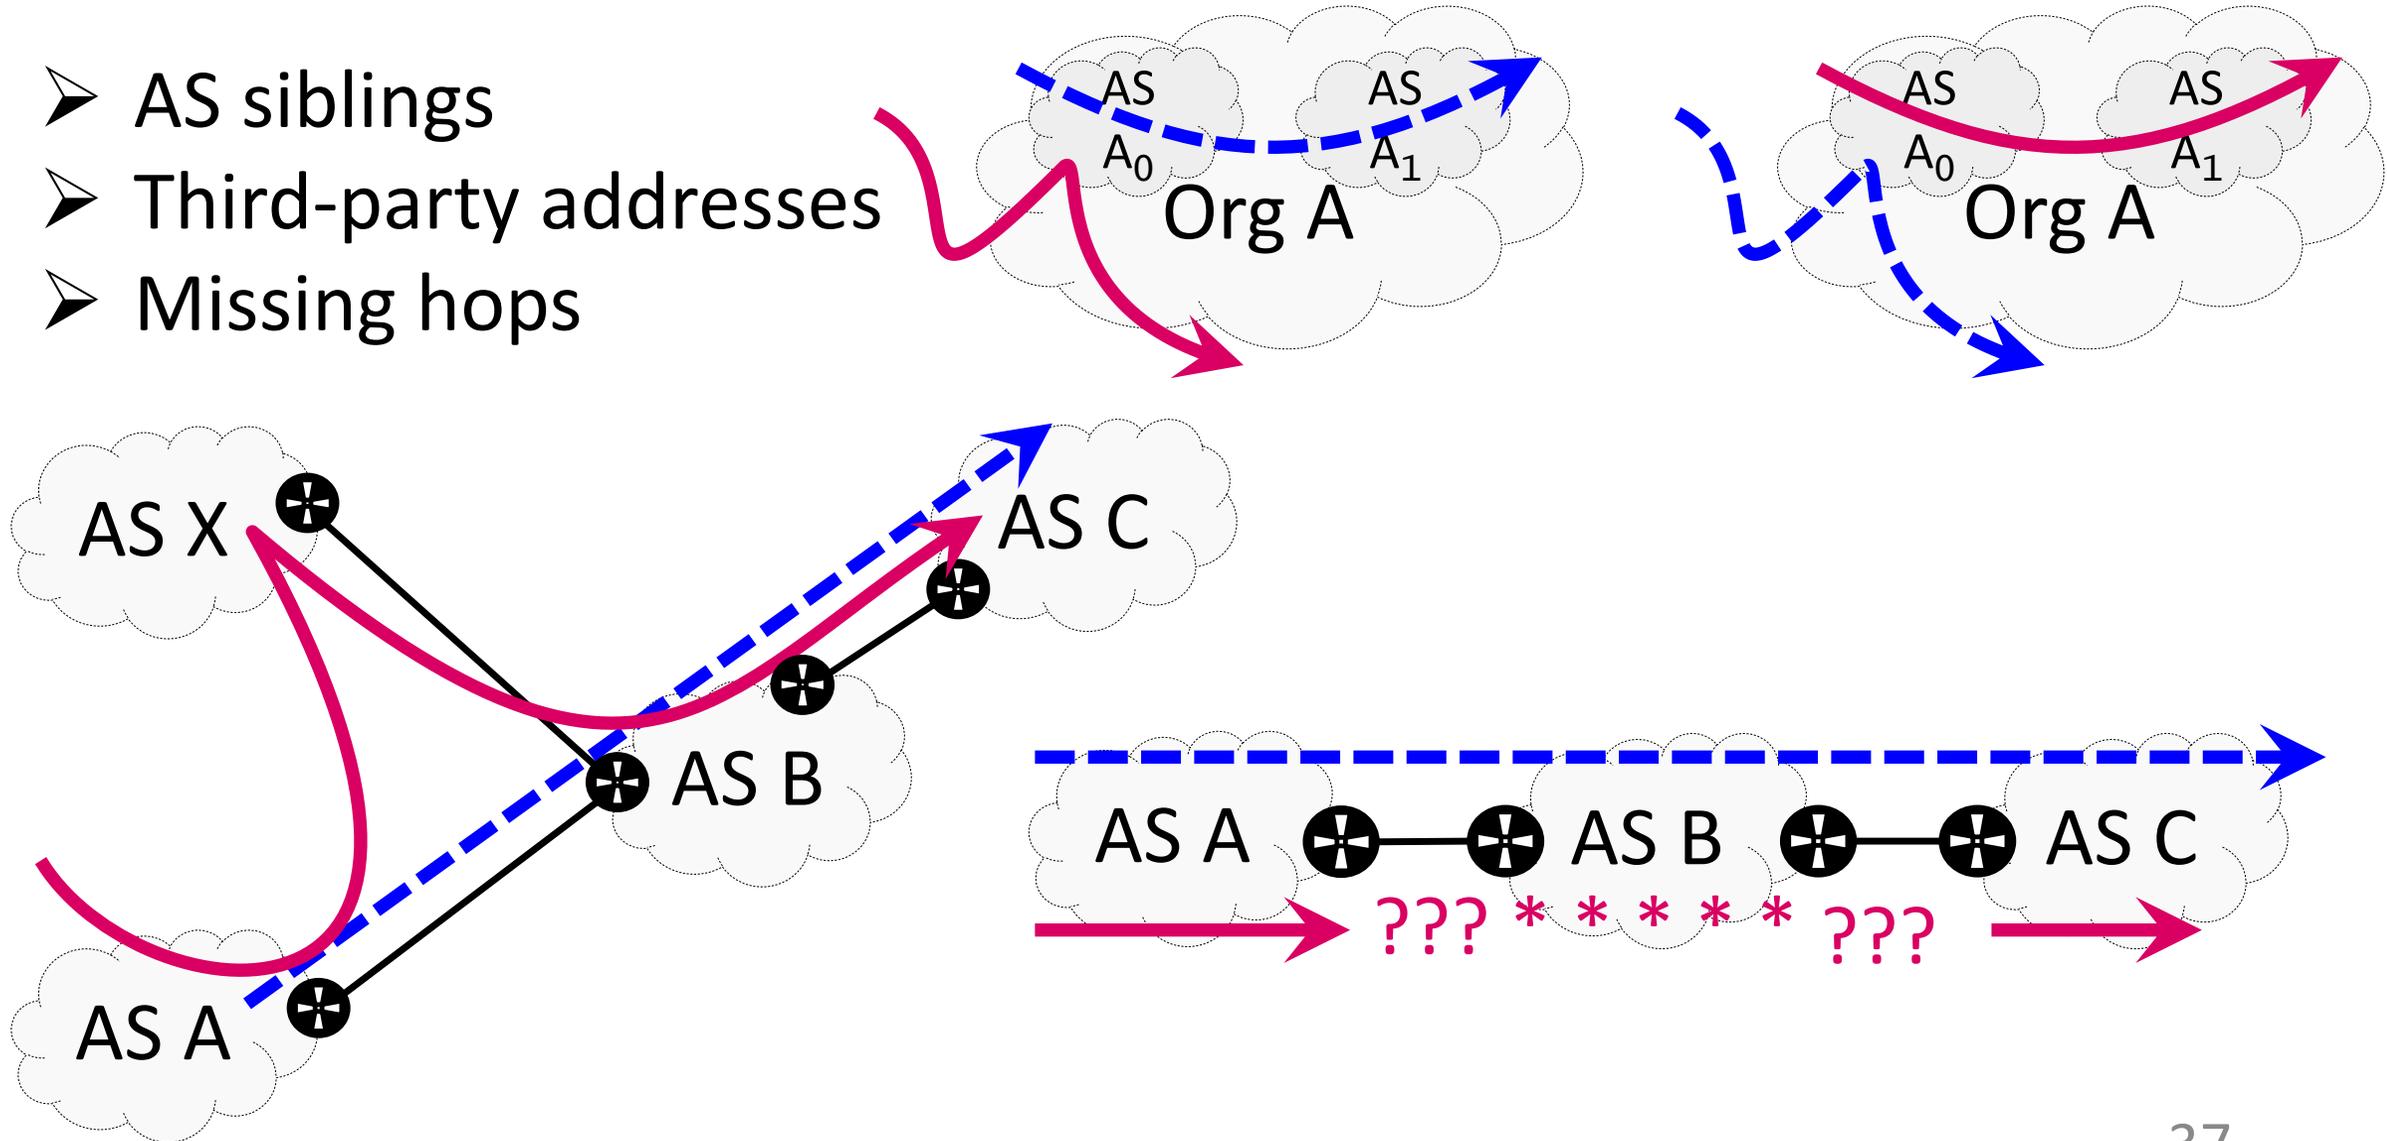

# Noise or sources of errors

- AS siblings
- Third-party addresses

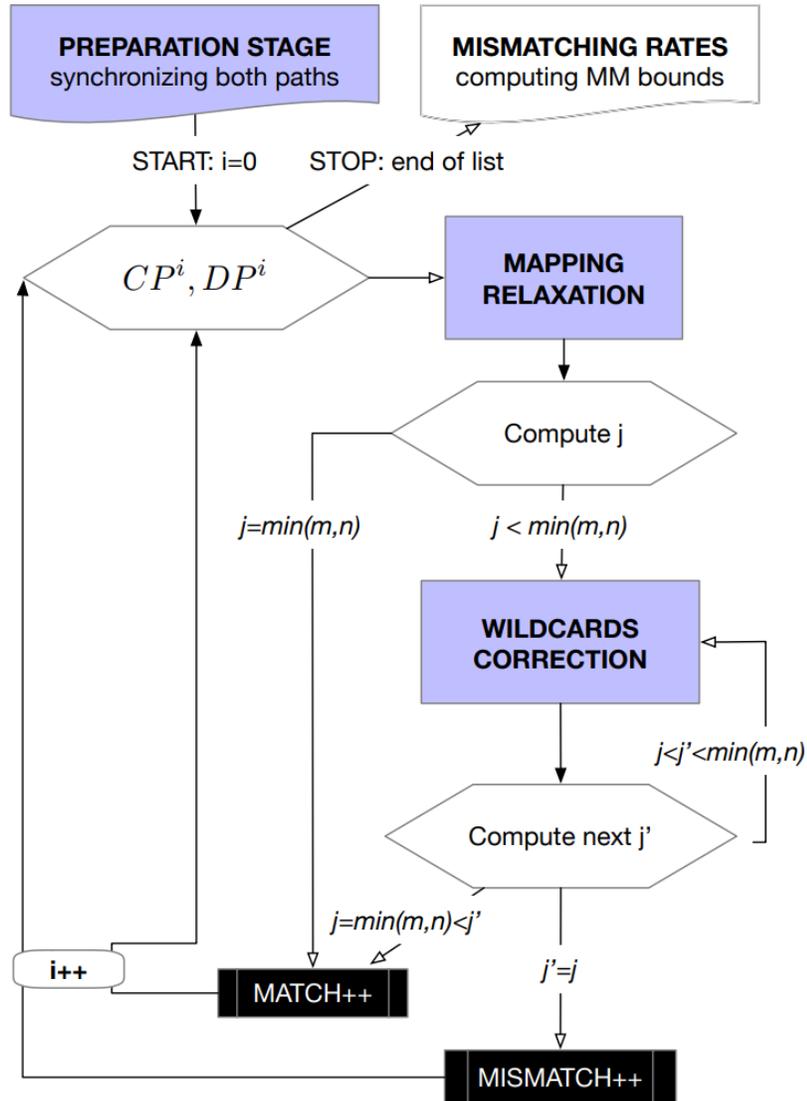

# Noise or sources of errors

- AS siblings
- Third-party addresses
- Missing hops

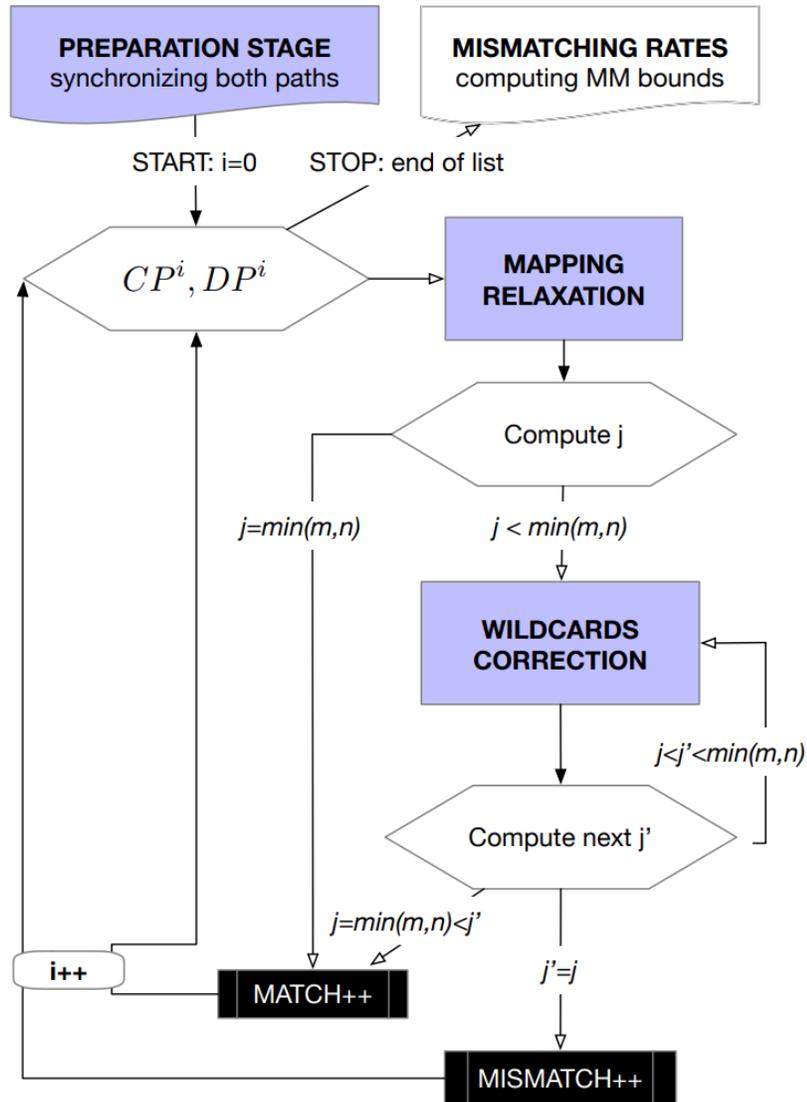

# **Our solution**

# A framework to detect BGP lies

- ✓ **Input:** CPs and DPs from a co-located VP
- ✓ **Output:** rate of BGP lies

# A framework to detect BGP lies

- ✓ **Input:** CPs and DPs from a co-located VP
- ✓ **Output:** rate of BGP lies

## ❑ Preparation stage:

- Address space synchronization
- Time synchronization
- Basic IP-to-AS mapping

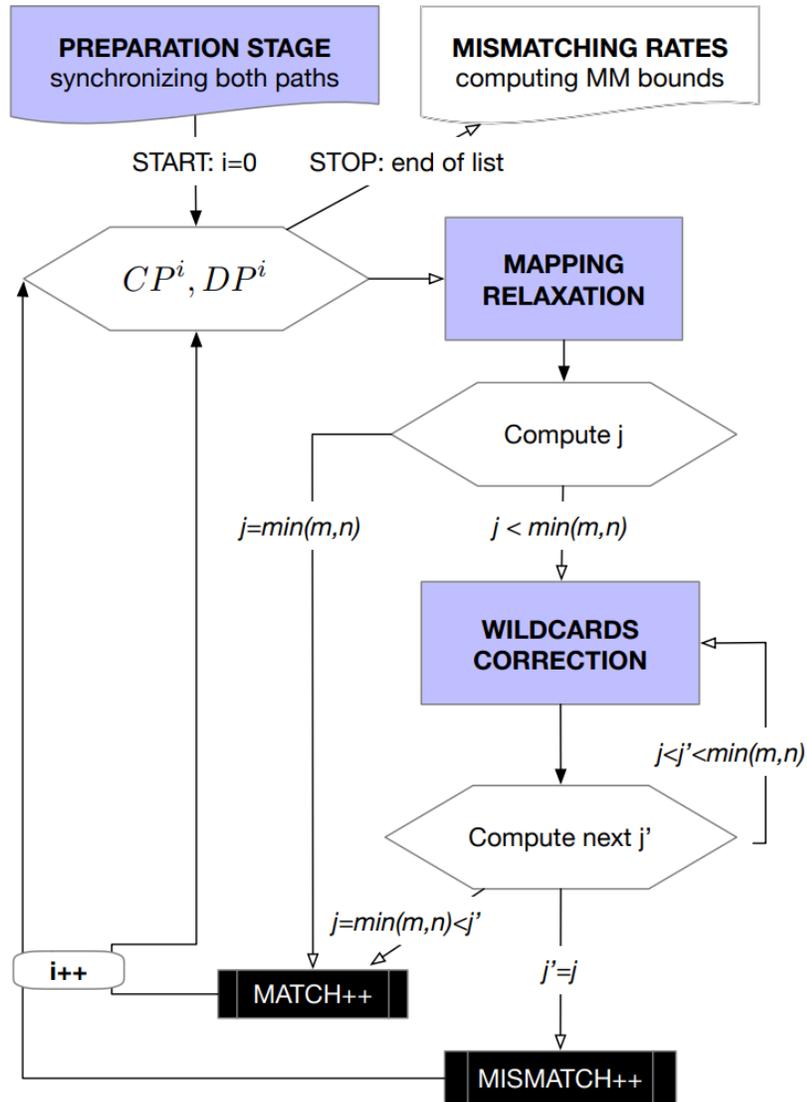

## ❑ Mapping relaxation

- AS siblings
- Third-party addresses

## ❑ Wildcards correction stage

- Missing hops

# A framework to detect BGP lies

- ✓ **Input:** CPs and DPs from a co-located VP
- ✓ **Output:** rate of BGP lies

## ❑ Preparation stage:

- Address space synchronization
- Time synchronization
- Basic IP-to-AS mapping

## ❑ Mapping relaxation

- AS siblings
- Third-party addresses

## ❑ Wildcards correction stage

- Missing hops

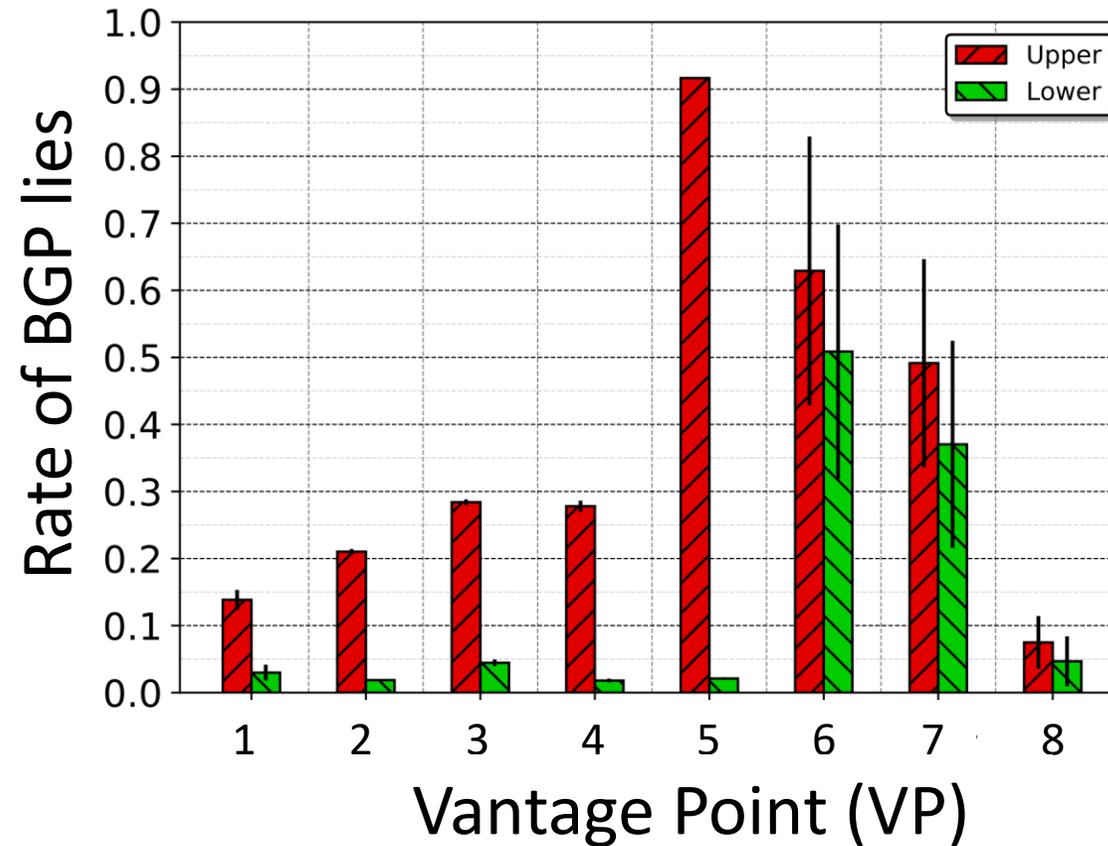

**...we are conservative!**

# Results

# Dataset

- Deployed 8 co-located VPs
- CPs collected every two hours
- DPs gathered targeting 80K destinations per day
- We run measurements multiple days (at least 13 days)

# Filtering the noise with our framework

- VP 6,7: High rate, high variance
- VP 1-5. Quite effective, low variance
- Ground truth: BGP lies due to technical limitations in VP 7
- ...then in VP 6 too? ...and VP 1-5 malicious behaviour?

# Conclusions

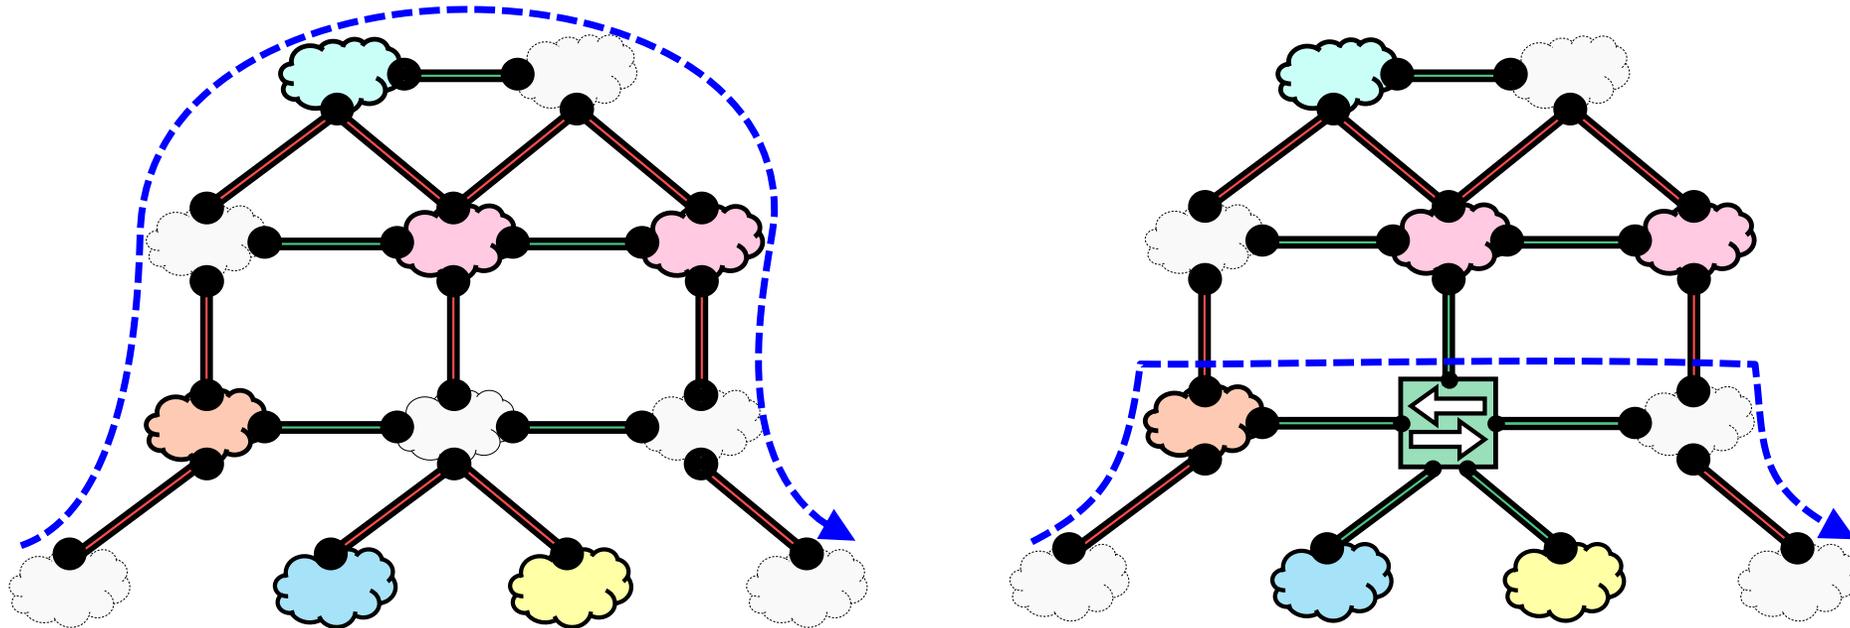

- ❖ A framework to detect BGP lies filtering the IP-to-AS mapping noise
- ❖ Deployed more co-located VPs than previous work
- ❖ Run the first time-analysis comparing CPs and DPs
- ❖ Patterns in results: technical limitations vs malicious Ases?

# Outline

- Background, Research Goal and Questions
- Part I. Filtering the noise to reveal BGP lies
- **Part II. Success and Failure of IXPs in Latin America**
- Part III. The Art of Detecting Forwarding Detours
- Conclusions and Future Work

# Why IXPs?

- Reshaped the structure of the Internet

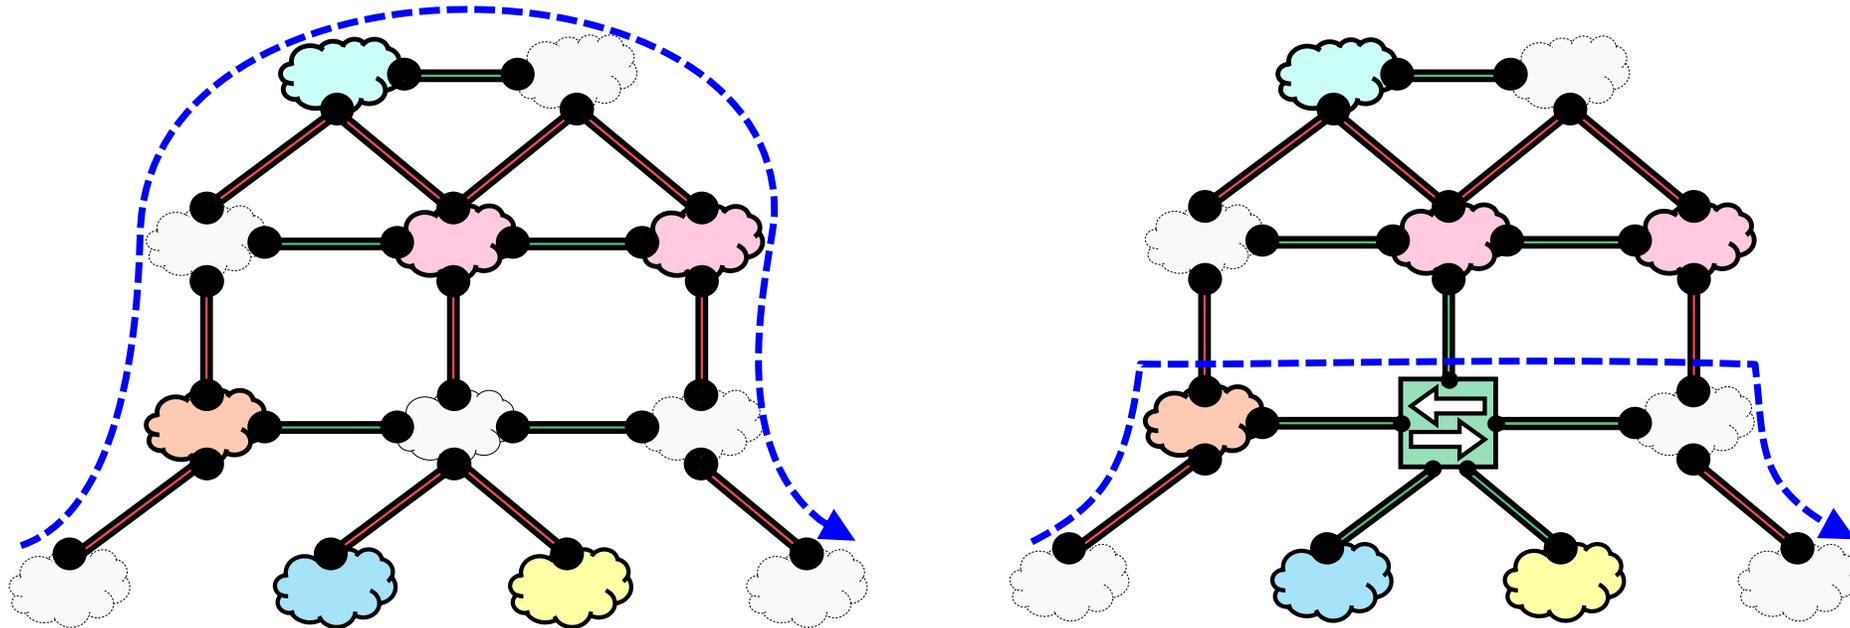

## Why Latin America?

- Little previous work
- Discovered “new” datasets

# Why IXPs?

- Reshaped the structure of the Internet

## Why Latin America?

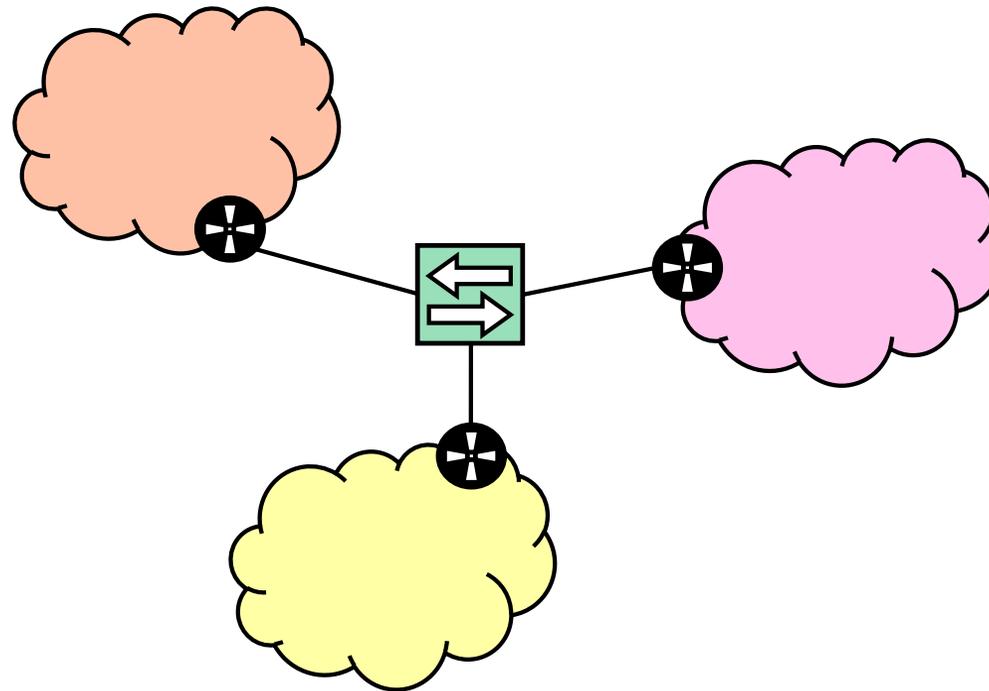

- Little previous work
- Discovered “new” datasets
- ...and I come from there ❤️

# **General Knowledge on IXPs**

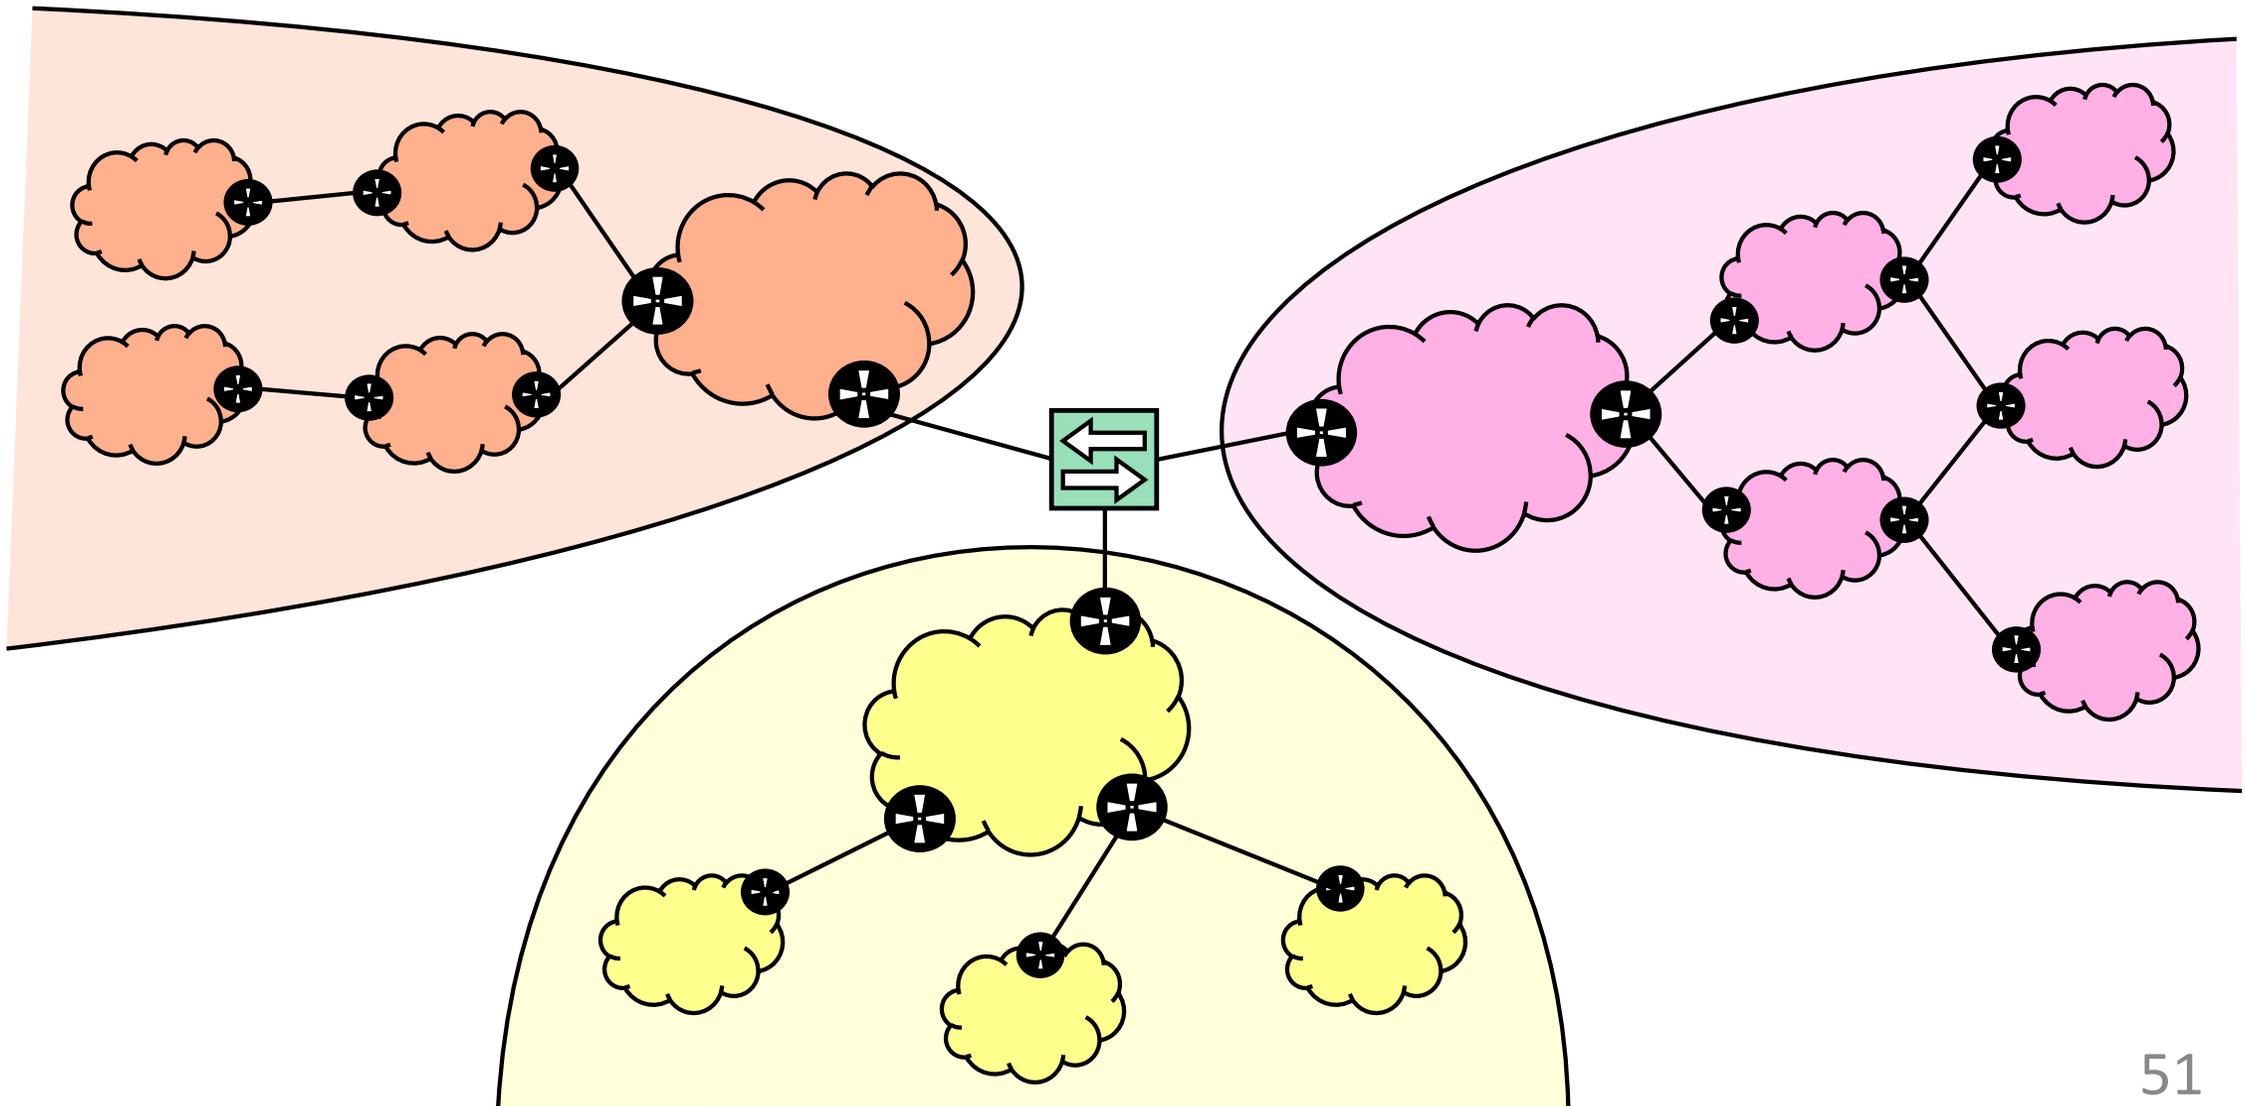

# IXP Members

ASes that connect to the IXP and announce IP prefixes

# Visible ASes of an IXP

IXP members + ASes seen in AS-paths announced by members

# **Preliminary Results**

# Dataset

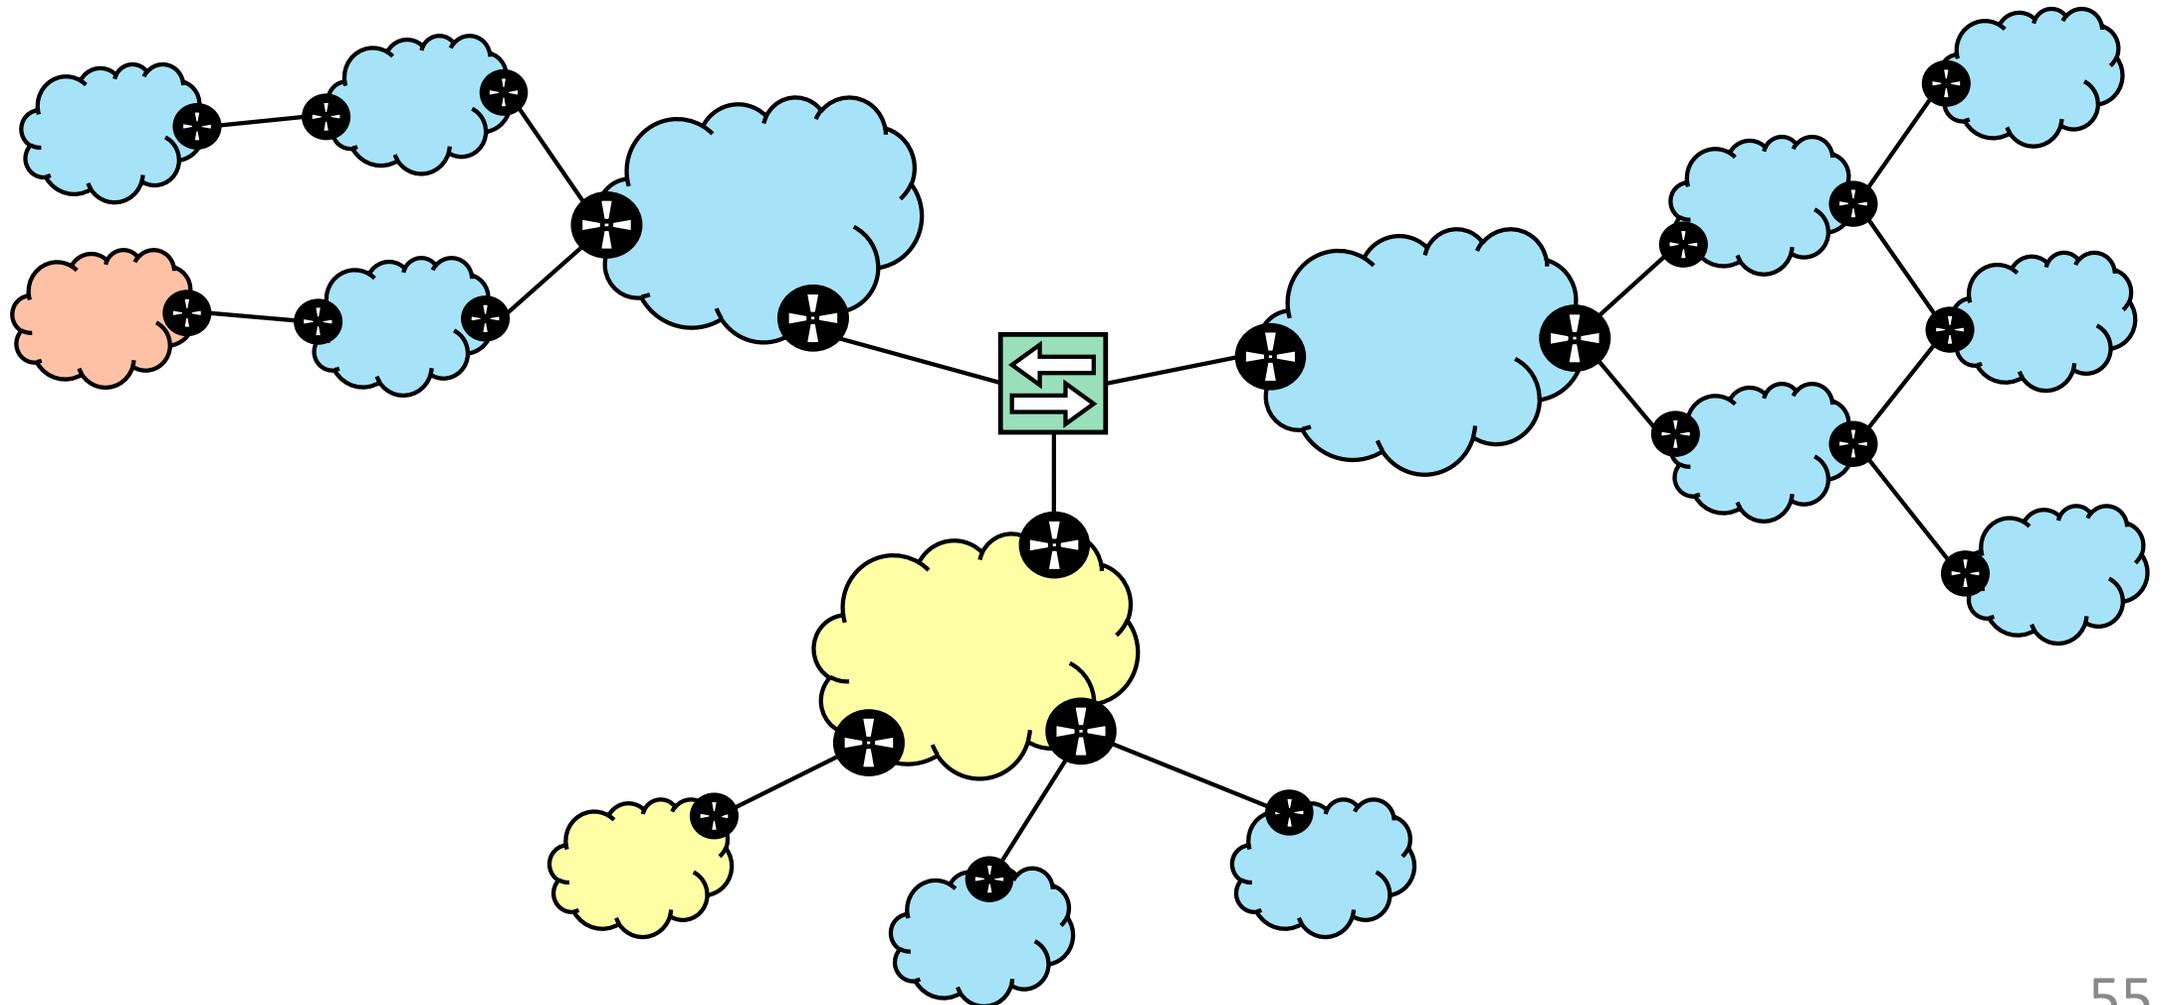

- Control paths gathered in the IXPs
  - Members
  - Set of visible Ases
  - IP addresses announced
  
- Regional Internet registry files
  - Nationality of ASes

## Success or Failure?

- Most IXPs in Latin America have low impact, or are failed IXPs
  - Less than 30 members
  - Less than 2M IP addresses announced
- The exception are Argentina, Brazil and Chile, the successful ones

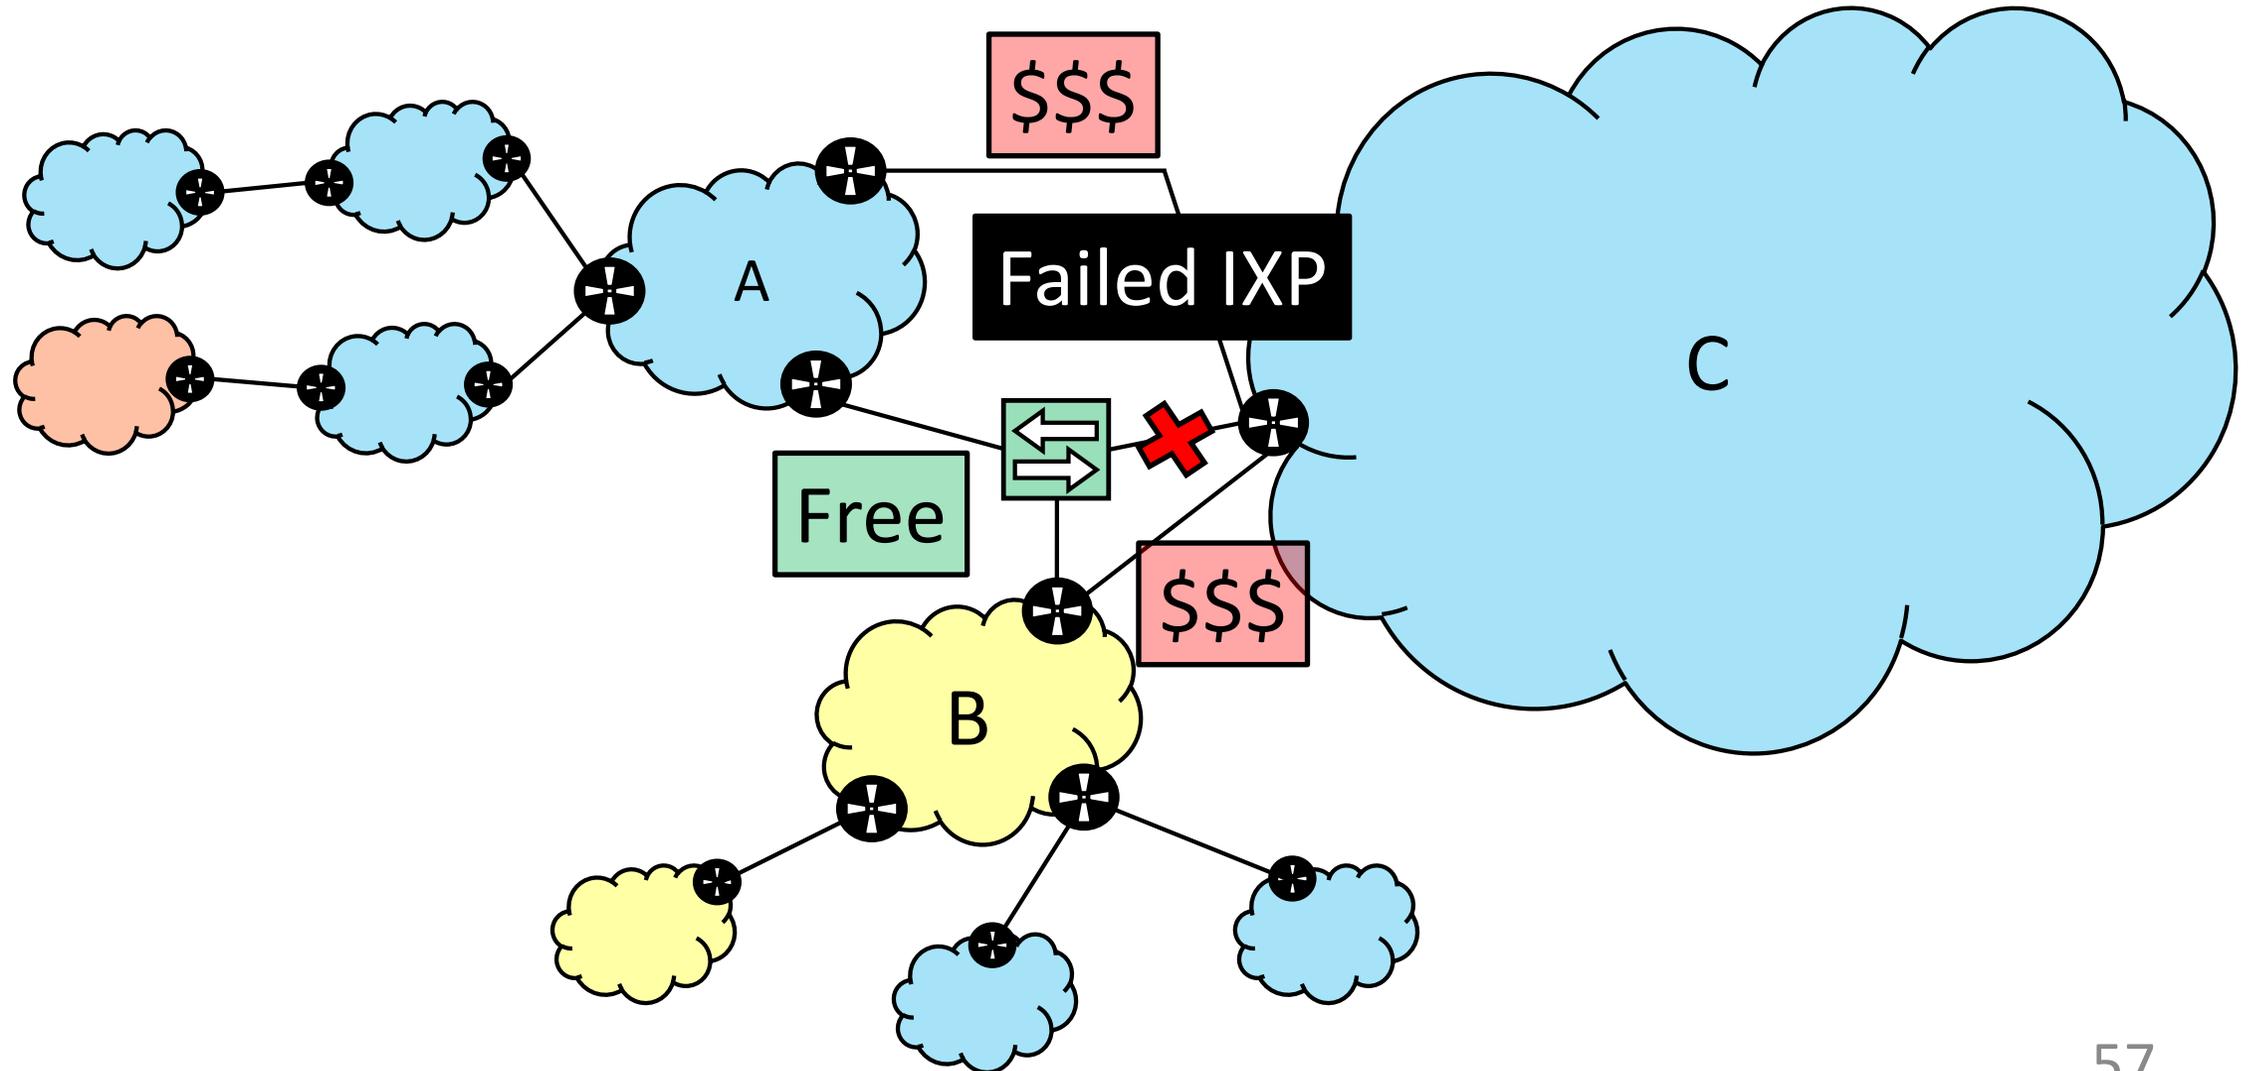

# Most visible ASes in Latin American IXPs are local ASes

...consider color as nationality...

**In the countries with Failed IXPs,  
are IP addresses fairly distributed among local Ases?**

# Maybe a monopolistic AS prefers not to peer in the IXP

# How to measure whether the distribution is fair or not?

- We use the Herfindahl Hirschman Index (HHI)
  - Select a country
  - Choose 2 IPs of that country at random
  - Odds they belong to the same AS

# How to measure whether the distribution is fair or not?

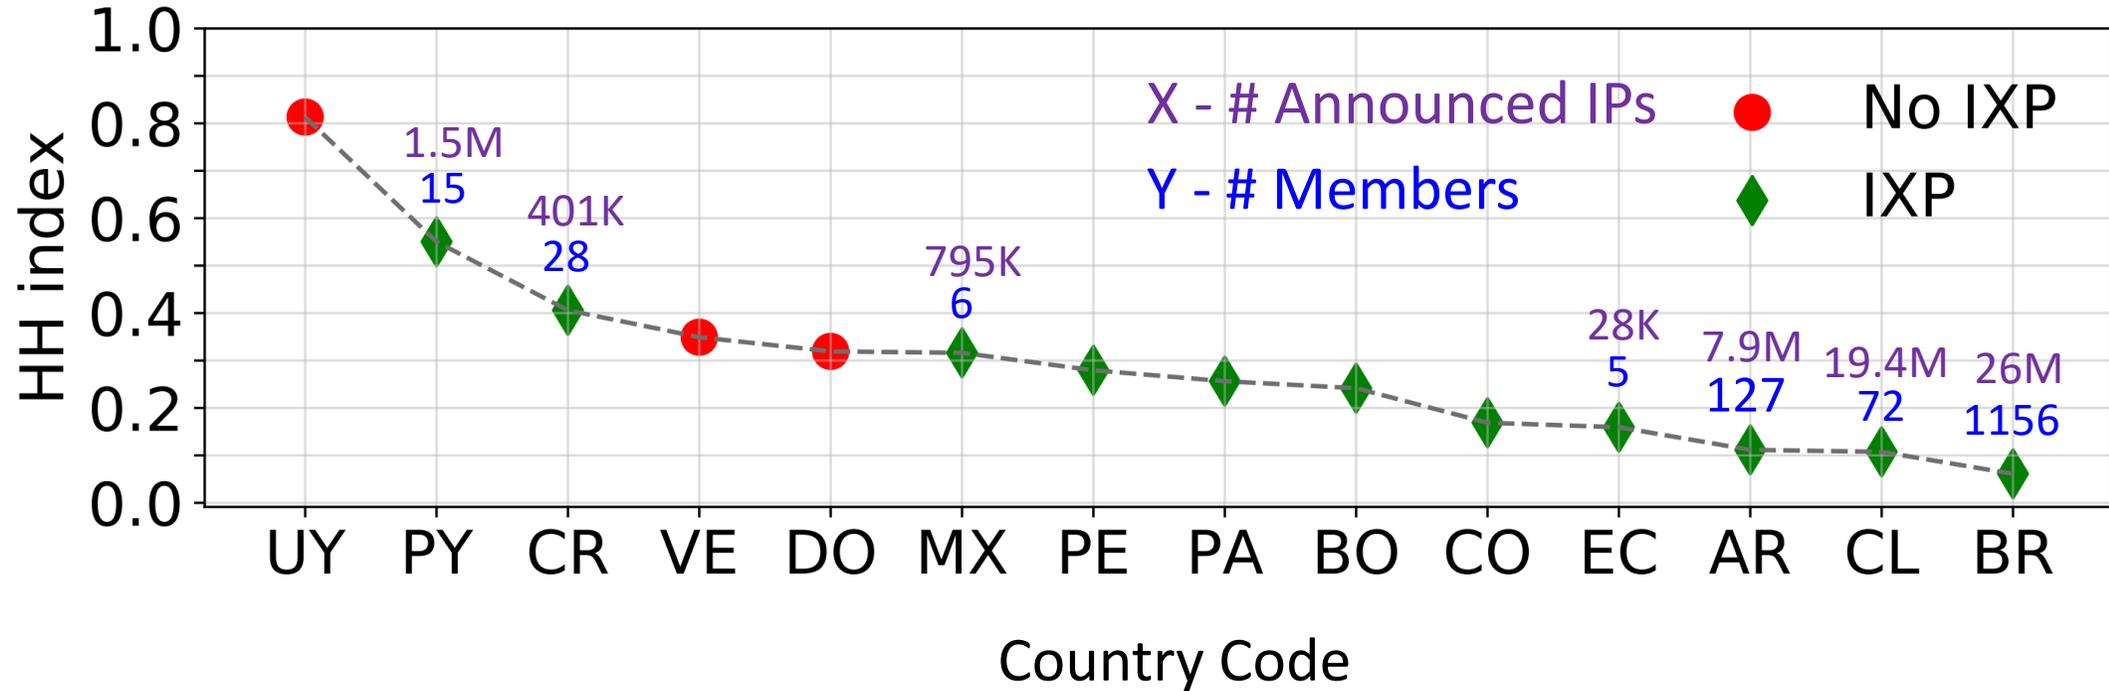

- We use the Herfindahl Hirschman Index (HHI)
  - Select a country
  - Choose 2 IPs of that country at random
  - Odds they belong to the same AS
  - The closer to 0, the more fair
  - The closer to 1, the more concentrated

# Results

# Dataset

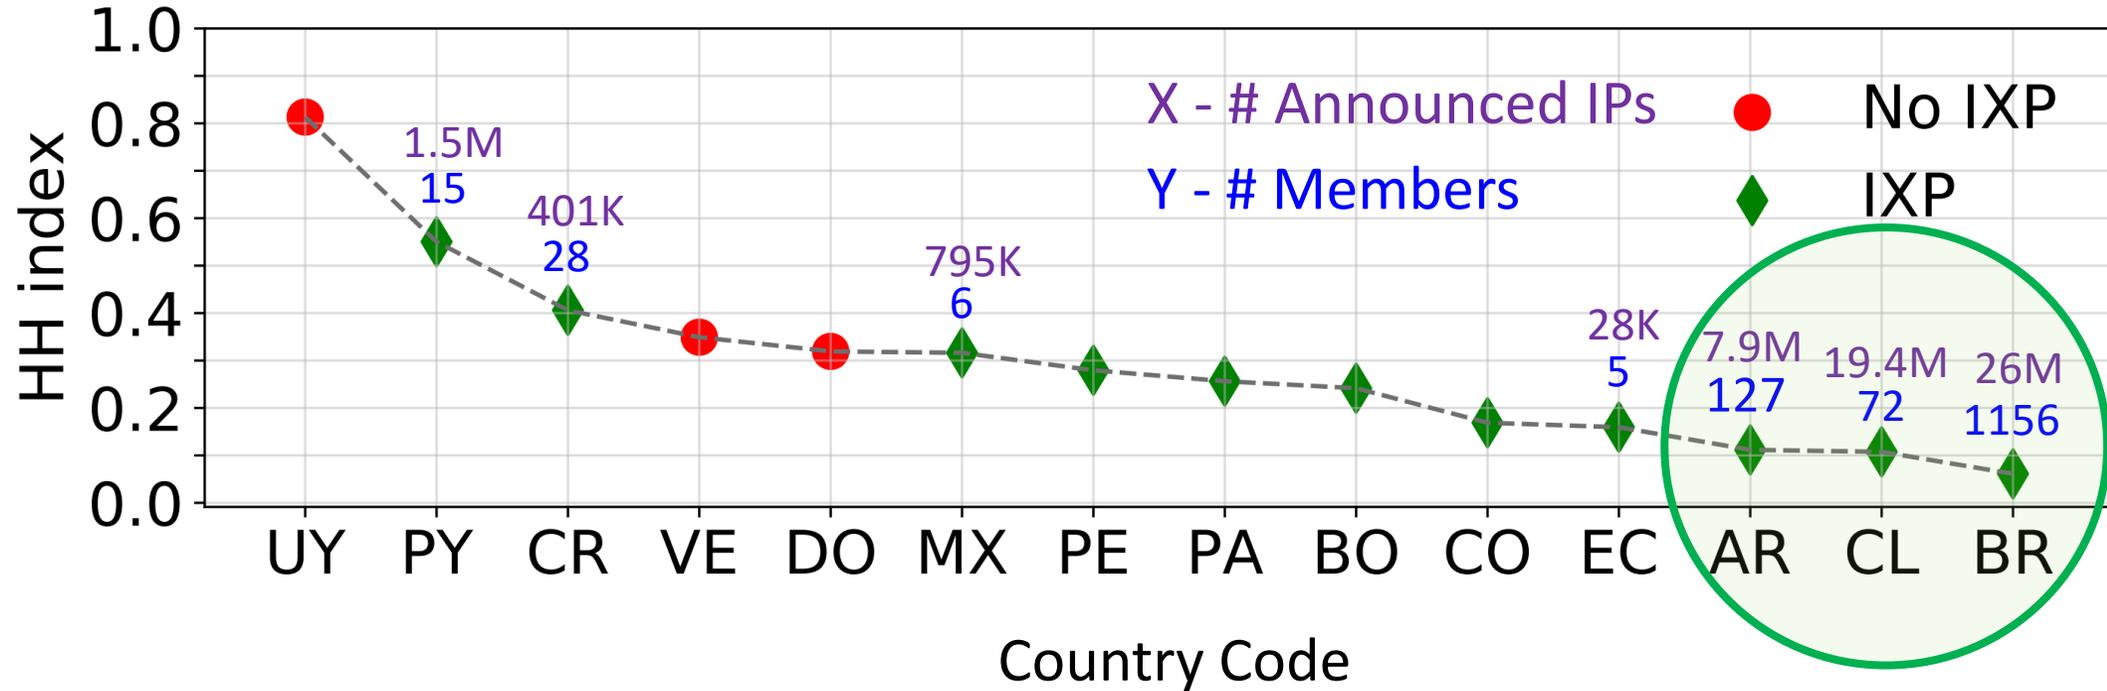

- Control paths gathered in the IXPs
  - Members
  - Set of visible Ases
  - IP addresses announced
- Regional Internet registry files
  - Nationality of Ases
- Prefix-to-AS files
  - IP addresses that are actively used on the Internet

# Concentration vs Success

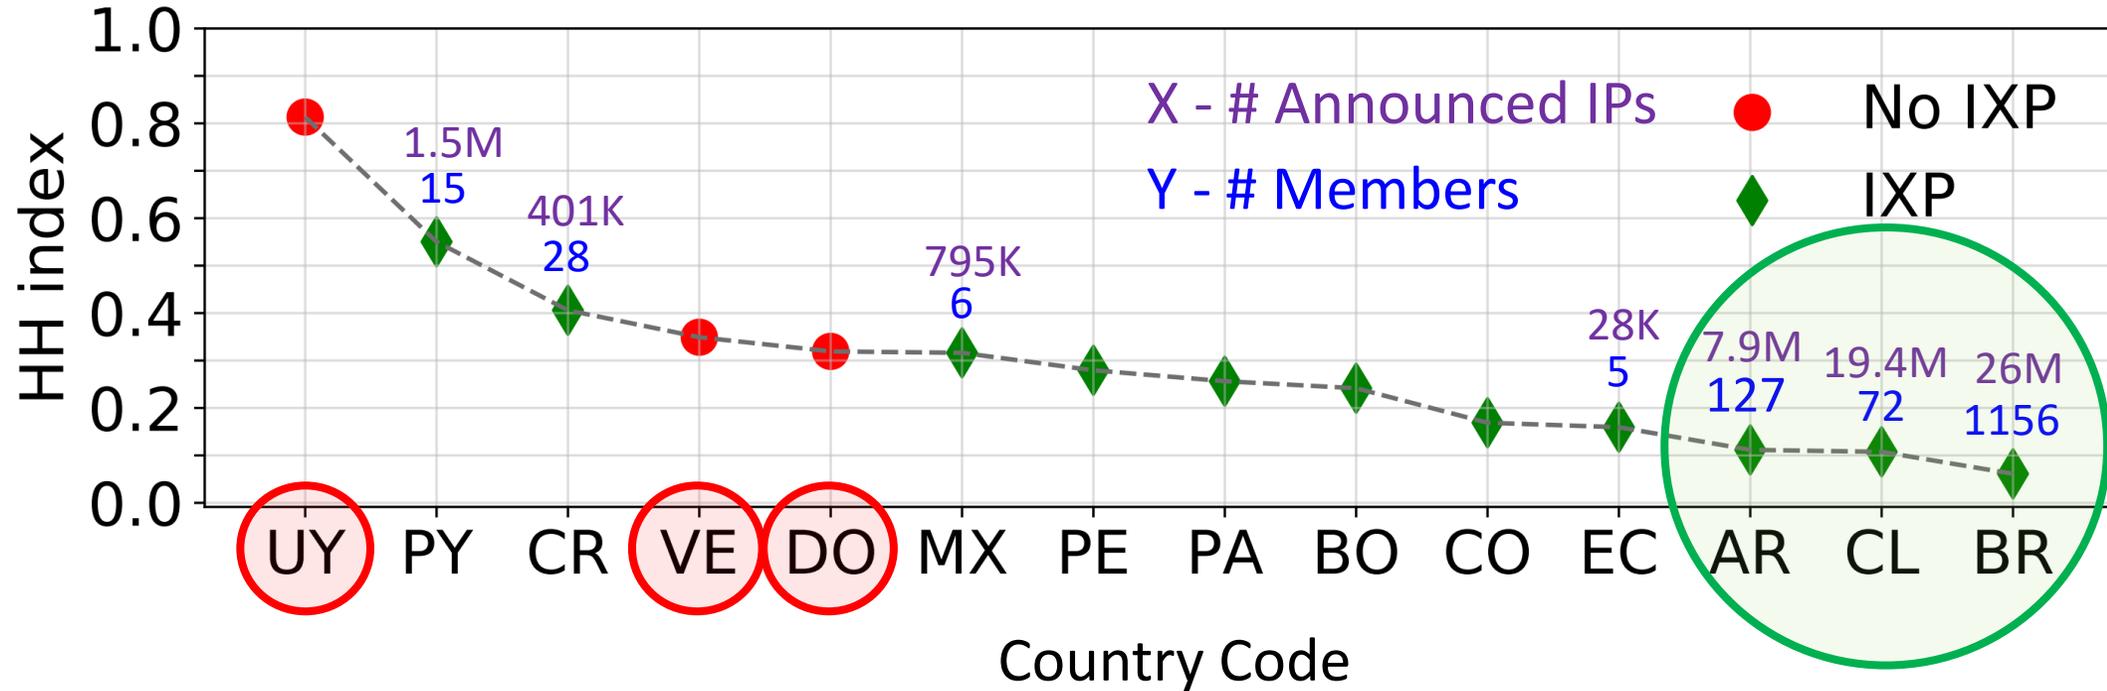

- Countries with more than 1M active IP addresses are displayed

# Concentration vs Success

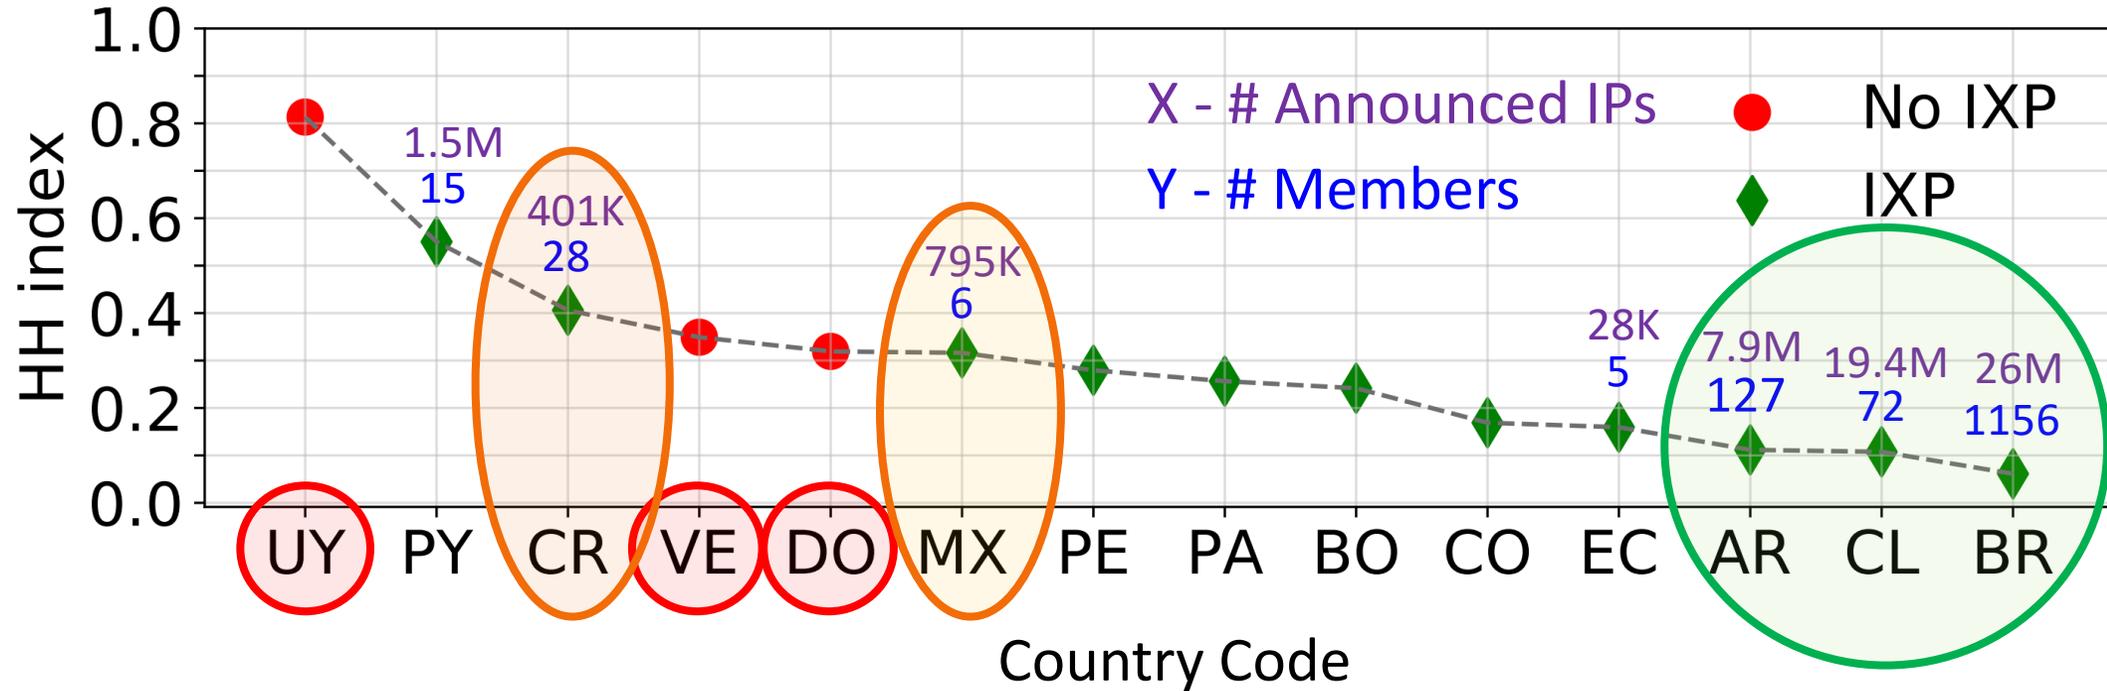

- Countries with more than 1M active IP addresses are displayed
- AR, CL, BR: largest IXPs, lowest HHI

# Concentration vs Success

- Countries with more than 1M active IP addresses are displayed
- AR, CL, BR: largest IXPs, lowest HHI
- UY, VE, DO: no IXP at all

# Concentration vs Success

- Countries with more than 1M active IP addresses are displayed
- AR, CL, BR: largest IXPs, lowest HHI
- UY, VE, DO: no IXP at all
- CR, MX: there is an IXP, but monopolistic local ASes not peering

# Conclusions

- ❖ First to study Latin American IXPs in depth
- ❖ The region has many failed IXPs
- ❖ Visible ASes are mainly local ASes
- ❖ Possible correlation between failed IXPs and concentrated markets

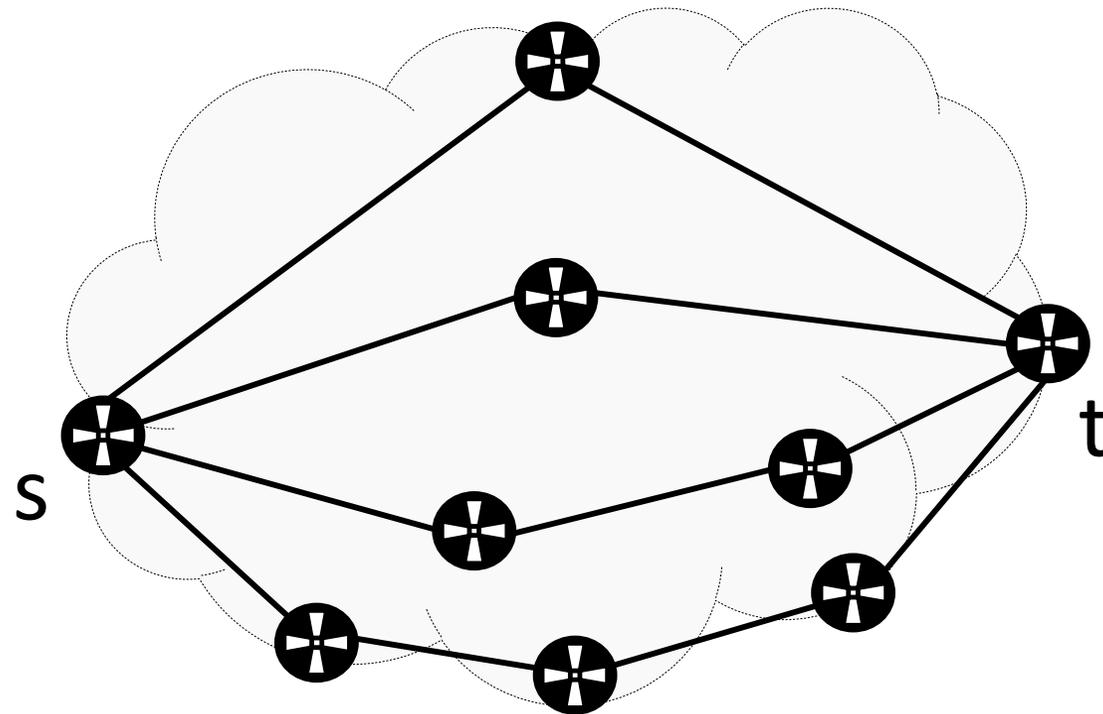

# Outline

- Background, Research Goal and Questions
- Part I. Filtering the noise to reveal BGP lies
- Part II. Success and Failure of IXPs in Latin America
- **Part III. The Art of Detecting Forwarding Detours**
- Conclusions and Future Work

# The basics

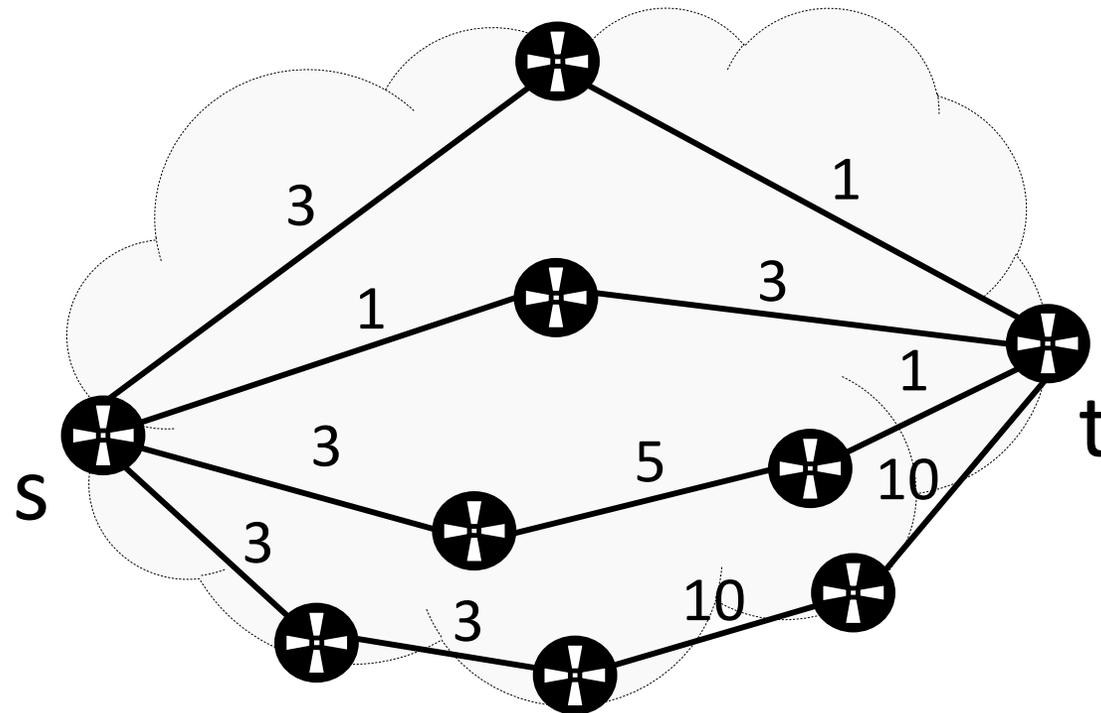

# Internal Gateway Protocols (IGPs)

- Routing inside networks

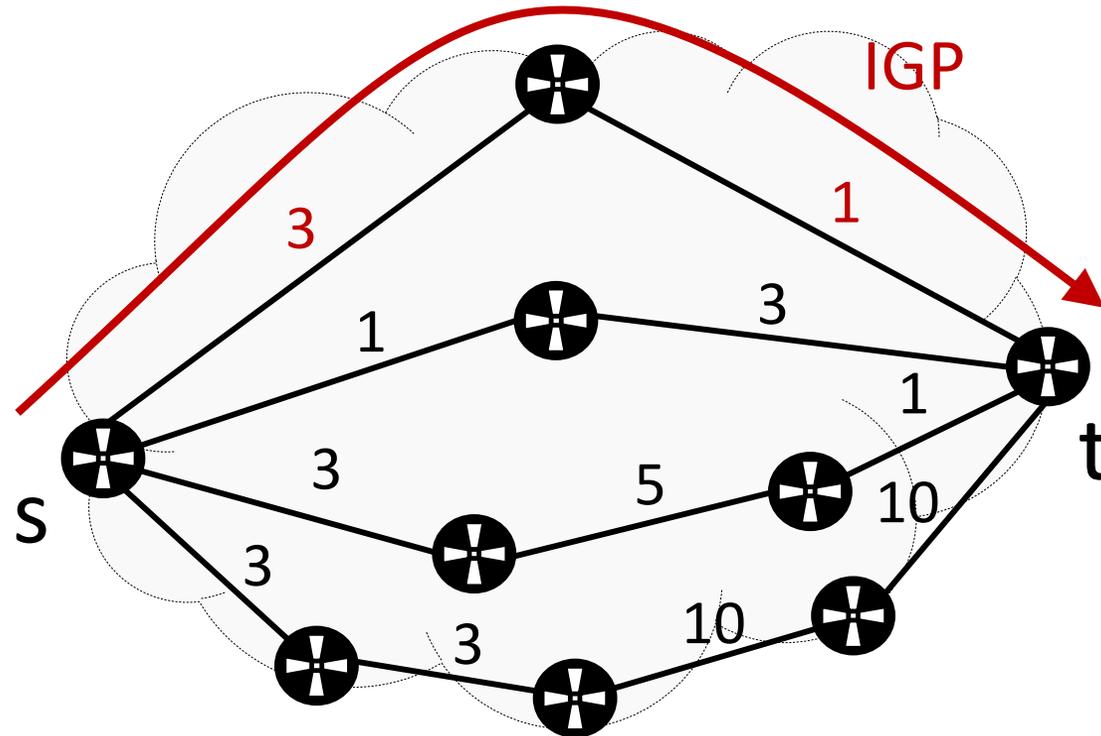

# Internal Gateway Protocols (IGPs)

- Routing inside networks
- Links have a cost according to some metric

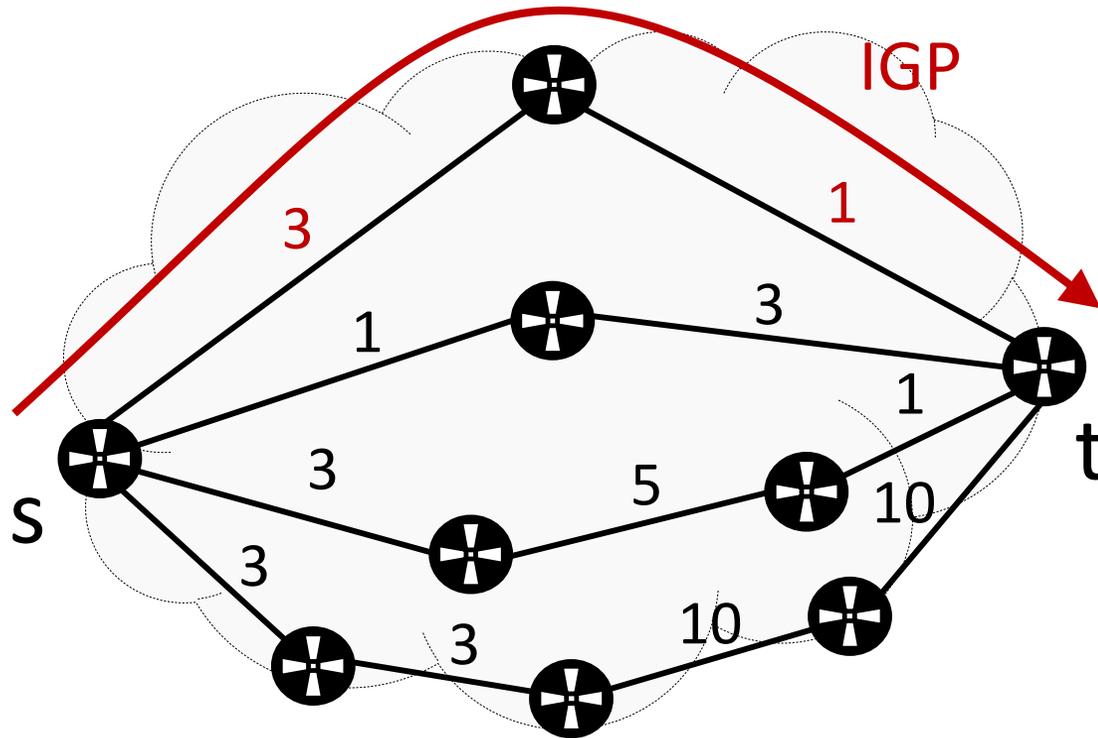

# Internal Gateway Protocols (IGPs)

- Routing inside networks
- Links have a cost according to some metric
- The path with minimum cost is used

# Internal Gateway Protocols (IGPs)

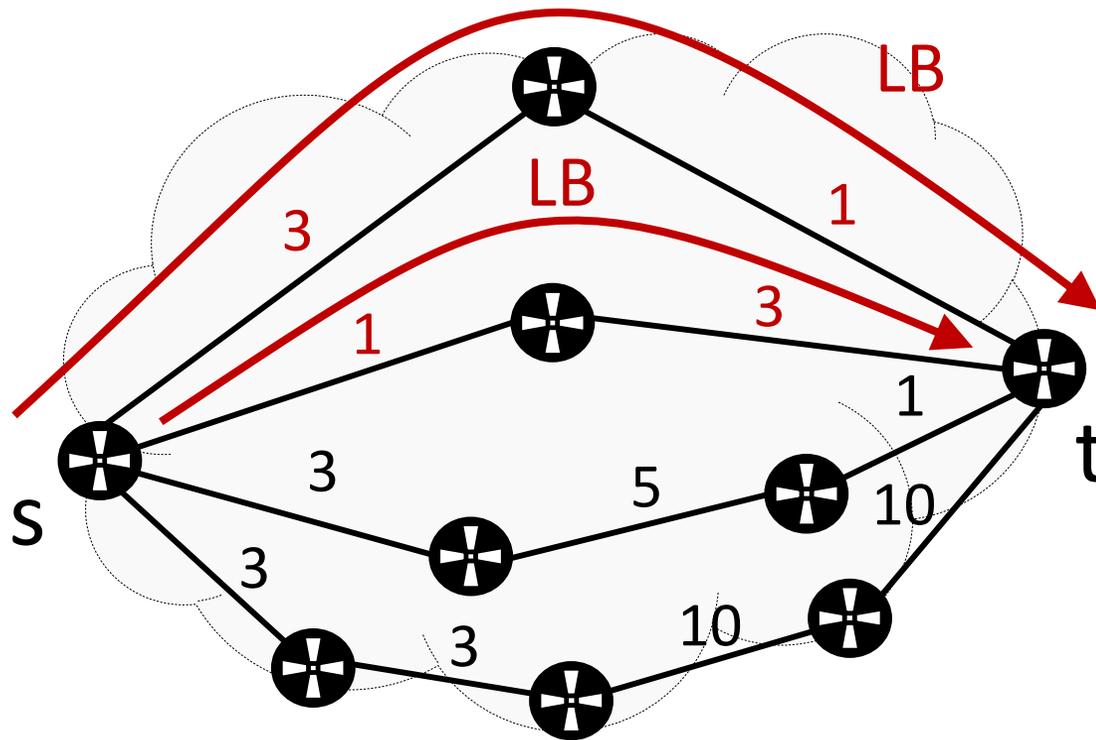

- Routing inside networks
- Links have a cost according to some metric
- The path with minimum cost is used

IGP		Routes			
		$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	$P_1$	⊙⊙			
	$P_2$	⊙⊙			
	$P_3$	⊙⊙			
	$P_4$	⊙⊙			
	$P_5$	⊙⊙			
	$P_6$	⊙⊙			
	$P_7$	⊙⊙			
	$P_8$	⊙⊙			

# Load Balancing (LB)

- From one to many best IGP paths
- Usually deployed with equal-cost multipath (ECMP)

		Routes			
		$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	$P_1$	⊙	⊙		
	$P_2$	⊙	⊙		
	$P_3$	⊙	⊙		
	$P_4$	⊙	⊙		
	$P_5$	⊙	⊙		
	$P_6$	⊙	⊙		
	$P_7$	⊙	⊙		
	$P_8$	⊙	⊙		

A red oval highlights the  $R_2$  column in the table, indicating that traffic for all eight prefixes is being load-balanced across this specific route.

# Traffic Engineering (TE)

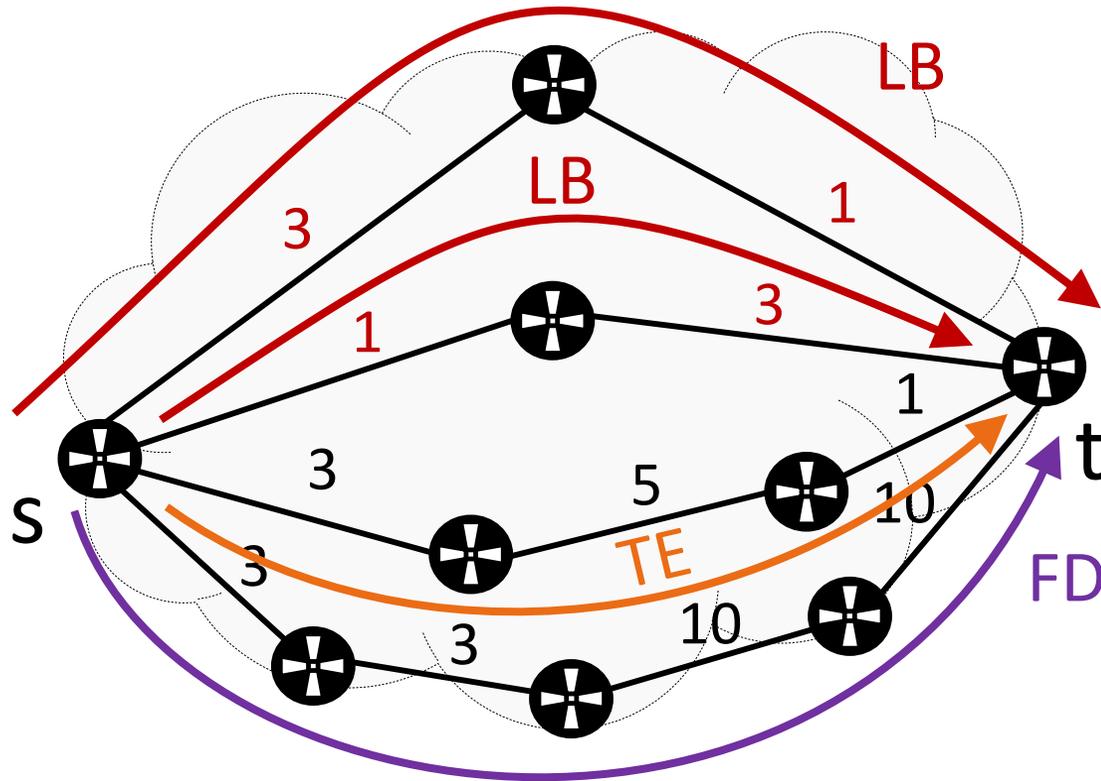

- Allows to craft paths “by hand”
- The crafted paths meet some requirements, e.g. low delay

		Routes			
		$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	LB				
	TE				
	$P_1$	⊙ ⊙	⊙ ⊙		
	$P_2$	⊙ ⊙	⊙ ⊙		
	$P_3$	⊙ ⊙	⊙ ⊙		
	$P_4$			⊙ ⊙ ⊙ ⊙	
	$P_5$	⊙ ⊙	⊙ ⊙		
	$P_6$	⊙ ⊙	⊙ ⊙		
$P_7$	⊙ ⊙	⊙ ⊙			
$P_8$	⊙ ⊙	⊙ ⊙			

# Forwarding Detours (FDs)

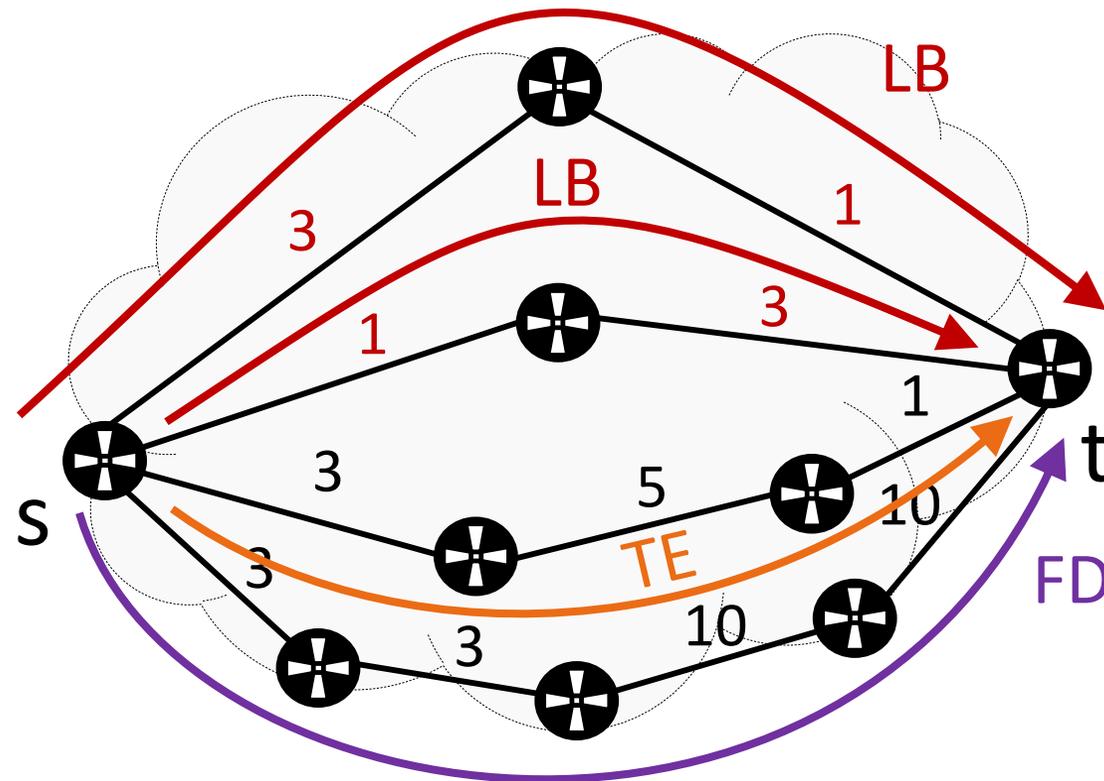

- When the forwarding route diverges from LB and TE paths

		Routes			
		$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	LB				
	TE				
	FD				
	$P_1$	⊙ ⊙	⊙ ⊙		
	$P_2$	⊙ ⊙	⊙ ⊙		
	$P_3$	⊙ ⊙	⊙ ⊙		
	$P_4$			⊙ ⊙ ⊙ ⊙	
	$P_5$	⊙ ⊙	⊙ ⊙		
$P_6$	⊙ ⊙	⊙ ⊙			
$P_7$				⊙ ⊙ ⊙ ⊙	
$P_8$	⊙ ⊙	⊙ ⊙			

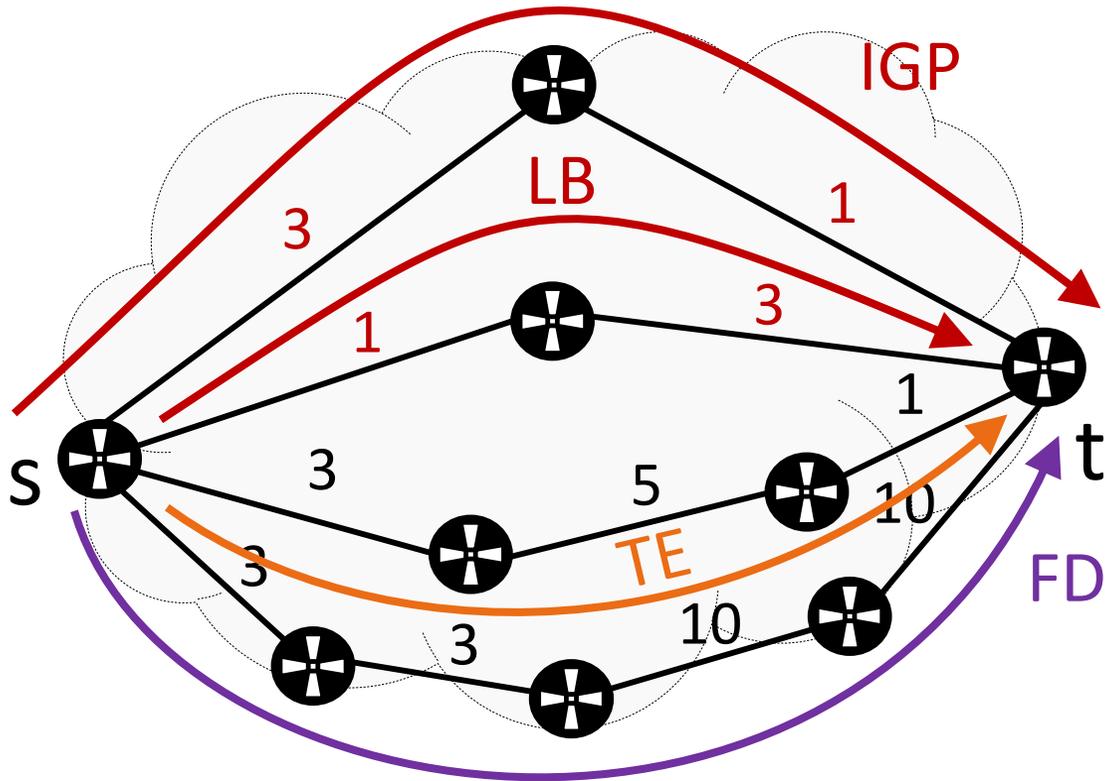

# Why detecting FDs?

- FDs relate to unexpected paths being used
- Possible negative impact on performance

# **Methodology to detect FDs**

# Forwarding Pattern - Run measurements and find the matrix

Example I

		Routes			
		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>
Prefixes	P <sub>1</sub>	⊙	⊙		
	P <sub>2</sub>	⊙	⊙		
	P <sub>3</sub>	⊙	⊙		
	P <sub>4</sub>			⊙	
	P <sub>5</sub>	⊙	⊙		
	P <sub>6</sub>	⊙	⊙		
	P <sub>7</sub>				⊙
	P <sub>8</sub>	⊙	⊙		

Example II

		Routes			
		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>
Prefixes	P <sub>1</sub>				⊙
	P <sub>2</sub>				⊙
	P <sub>3</sub>				⊙
	P <sub>4</sub>			⊙	
	P <sub>5</sub>	⊙	⊙		
	P <sub>6</sub>	⊙	⊙		
	P <sub>7</sub>				⊙
	P <sub>8</sub>				⊙

# Concluding if FDs occur

		Example I				Example II			
	LB TE FD	Routes				Routes			
		$R_1$	$R_2$	$R_3$	$R_4$	$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	$P_1$	⊙ ⊙	⊙ ⊙						⊙ ⊙
	$P_2$	⊙ ⊙	⊙ ⊙						⊙ ⊙
	$P_3$	⊙ ⊙	⊙ ⊙						⊙ ⊙
	$P_4$			⊙ ⊙				⊙ ⊙	
	$P_5$	⊙ ⊙	⊙ ⊙			⊙ ⊙	⊙ ⊙		
	$P_6$	⊙ ⊙	⊙ ⊙			⊙ ⊙	⊙ ⊙		
	$P_7$								⊙ ⊙
	$P_8$	⊙ ⊙	⊙ ⊙						⊙ ⊙

# Concluding if FDs occur

1. Identify prefixes related to the same routes

		Example I				Example II				
	LB TE FD	Routes				LB TE FD	Routes			
		$R_1$	$R_2$	$R_3$	$R_4$		$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	$P_1$	⊙ ⊙	⊙ ⊙						⊙⊙ ⊙⊙	
	$P_2$	⊙ ⊙	⊙ ⊙						⊙⊙ ⊙⊙	
	$P_3$	⊙ ⊙	⊙ ⊙						⊙⊙ ⊙⊙	
	$P_4$			⊙⊙ ⊙⊙				⊙⊙ ⊙⊙		
	$P_5$	⊙ ⊙	⊙ ⊙			⊙ ⊙	⊙ ⊙			
	$P_6$	⊙ ⊙	⊙ ⊙			⊙ ⊙	⊙ ⊙			
	$P_7$								⊙⊙ ⊙⊙	
	$P_8$	⊙ ⊙	⊙ ⊙						⊙⊙ ⊙⊙	

# Concluding if FDs occur

1. Identify prefixes related to the same routes

		Example I				Example II					
LB	TE	Routes				LB	TE	Routes			
		<i>R</i> <sub>1</sub>	<i>R</i> <sub>2</sub>	<i>R</i> <sub>3</sub>	<i>R</i> <sub>4</sub>			<i>R</i> <sub>1</sub>	<i>R</i> <sub>2</sub>	<i>R</i> <sub>3</sub>	<i>R</i> <sub>4</sub>
Prefixes	<i>P</i> <sub>1</sub>	⊙	⊙						⊙	⊙	
	<i>P</i> <sub>2</sub>	⊙	⊙						⊙	⊙	
	<i>P</i> <sub>3</sub>	⊙	⊙						⊙	⊙	
	<i>P</i> <sub>4</sub>			⊙	⊙			⊙	⊙		
	<i>P</i> <sub>5</sub>	⊙	⊙			⊙	⊙				
	<i>P</i> <sub>6</sub>	⊙	⊙			⊙	⊙				
	<i>P</i> <sub>7</sub>								⊙	⊙	
	<i>P</i> <sub>8</sub>	⊙	⊙						⊙	⊙	

# Concluding if FDs occur

1. Identify prefixes related to the same routes
2. Group the related prefixes in sets

		Example I				Example II					
LB	TE	Routes				LB	TE	Routes

Prefixes	P <sub>1</sub> , P <sub>2</sub> P <sub>3</sub> , P <sub>7</sub> P <sub>8</sub>				⊙⊙⊙⊙ ⊙⊙⊙⊙ ⊙⊙⊙⊙ ⊙⊙⊙⊙
	P <sub>4</sub>			⊙⊙	
	P <sub>5</sub> , P <sub>6</sub>	⊙⊙ ⊙⊙	⊙⊙		

# Concluding if FDs occur

1. Identify prefixes related to the same routes
2. Group the related prefixes in sets
3. Identify the LB set targeting router t

		Example I				Example II					
Prefixes	LB TE FD	Routes				Prefixes	LB TE FD	Routes			
		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>	
Prefixes	P <sub>1</sub> , P <sub>2</sub> P <sub>3</sub> , P <sub>5</sub> P <sub>6</sub> , P <sub>8</sub>	○○○○	○○○○						○○○○ ○○○○ ○○○○ ○○○○		
	P <sub>4</sub>			○○				○○			
	P <sub>7</sub>				○○				○○		
								○○	○○		

4. Compute #pfxs in each set: (6, 1, 1) and (5, 1, 2)

# Concluding if FDs occur

1. Identify prefixes related to the same routes
2. Group the related prefixes in sets
3. Identify the LB set targeting router t

		Example I				Example II					
Prefixes	LB TE FD	Routes				Prefixes	LB TE FD	Routes			
		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>	
Prefixes	P <sub>1</sub> , P <sub>2</sub> P <sub>3</sub> , P <sub>5</sub> P <sub>6</sub> , P <sub>8</sub>	⊙⊙ ⊙⊙ ⊙⊙ ⊙⊙	⊙⊙ ⊙⊙ ⊙⊙ ⊙⊙			Prefixes	P <sub>1</sub> , P <sub>2</sub> P <sub>3</sub> , P <sub>7</sub> P <sub>8</sub>				⊙⊙⊙⊙ ⊙⊙⊙⊙ ⊙⊙⊙⊙ ⊙⊙⊙⊙
	P <sub>4</sub>			⊙⊙			P <sub>4</sub>			⊙⊙	
	P <sub>7</sub>				⊙⊙			P <sub>5</sub> , P <sub>6</sub>	⊙⊙ ⊙⊙	⊙⊙ ⊙⊙	

4. Compute #pfxs in each set: (6, 1, 1) and (5, 1, 2)
5. Turn it into proportions: (0.75, 0.125, 0.125) and (0.625, 0.125, 0.25)

# Concluding if FDs occur

1. Identify prefixes related to the same routes
2. Group the related prefixes in sets
3. Identify the LB set targeting router  $t$

Example I

	LB TE FD	Routes			
		$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	$P_1, P_2$ $P_3, P_5$ $P_6, P_8$	○○○○	○○○○		
	$P_4$			○○	
	$P_7$				○○

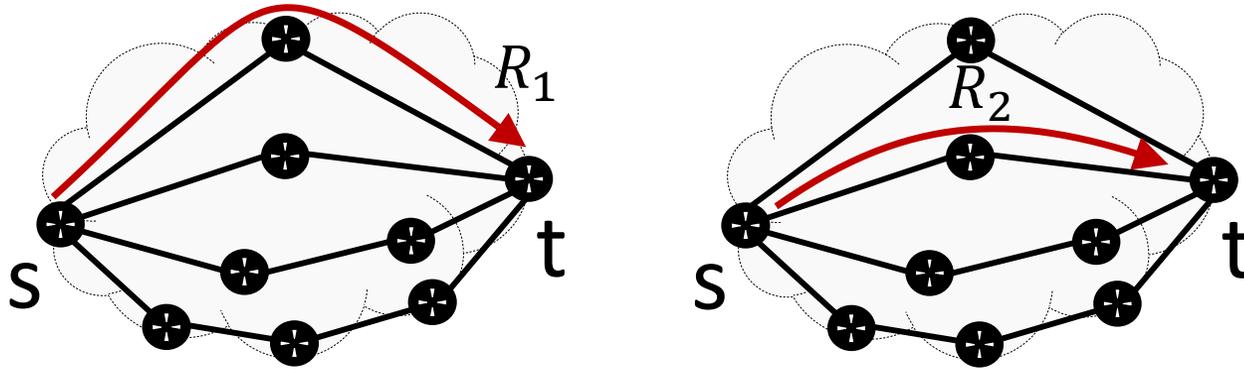

Example II

	LB TE FD	Routes			
		$R_1$	$R_2$	$R_3$	$R_4$
Prefixes	$P_1, P_2$ $P_3, P_7$ $P_8$				○○○○ ○○○○ ○○○○
	$P_4$			○○	
	$P_5, P_6$	○○	○○		

4. Compute #pfxs in each set: (6, 1, 1) and (5, 1, 2)
5. Turn it into proportions: (0.75, 0.125, 0.125) and (0.625, 0.125, 0.25)
6. Compute the  $n$  number of sets ... in this case  $n = 3$  for both examples...

# Concluding if FDs occur

1. Identify prefixes related to the same routes
2. Group the related prefixes in sets
3. Identify the LB set targeting router t

		Example I				Example II			
Prefixes	LB TE FD	Routes				Routes			
		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>	R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>
P <sub>1</sub> , P <sub>2</sub> P <sub>3</sub> , P <sub>5</sub> P <sub>6</sub> , P <sub>8</sub>		●●●●	●●●●						●●●● ●●●● ●●●● ●●●●
P <sub>4</sub>				●●				●●	
P <sub>7</sub>					●● ●●				
P <sub>5</sub> , P <sub>6</sub>		●● ●●	●● ●●						

4. Compute #pfxs in each set: (6, 1, 1) and (5, 1, 2)
5. Turn it into proportions: (0.75, 0.125, 0.125) and (0.625, 0.125, 0.25)
6. Compute the n number of sets ... in this case n = 3 for both examples...
7. Conclude that FDs occur if LB is associated to less than  $\frac{1}{n} = 0.33$  pfxs...

# Concluding if FDs occur

1. Identify prefixes related to the same routes
2. Group the related prefixes in sets
3. Identify the LB set targeting router t

		Example I				Example II			
Prefixes	LB TE FD	Routes				Routes			
		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>	R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>
P <sub>1</sub> , P <sub>2</sub> P <sub>3</sub> , P <sub>5</sub> P <sub>6</sub> , P <sub>8</sub>		●●●●	●●●●						●●●● ●●●● ●●●● ●●●●
P <sub>4</sub>				●●				●●	
P <sub>7</sub>					●● ●●				
P <sub>5</sub> , P <sub>6</sub>		●● ●●	●● ●●						

4. Compute #pfxs in each set: (6, 1, 1) and (5, 1, 2)
5. Turn it into proportions: (0.75, 0.125, 0.125) and (0.625, 0.125, 0.25)
6. Compute the n number of sets ... in this case n = 3 for both examples...
7. Conclude that FDs occur if LB is associated to less than  $\frac{1}{n} = 0.33$  pfxs...

0.33 < 0.75 ... no FDs and 0.33 > 0.25 ... there are FDs

# Concluding if FDs occur

1. Identify prefixes related to the same routes
2. Group the related prefixes in sets
3. Identify the LB set targeting router t

		Example I				Example II			
Prefixes	LB TE FD	Routes				Routes			
		R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>	R <sub>1</sub>	R <sub>2</sub>	R <sub>3</sub>	R <sub>4</sub>
P <sub>1</sub> , P <sub>2</sub> P <sub>3</sub> , P <sub>5</sub> P <sub>6</sub> , P <sub>8</sub>		●●●●	●●●●						●●●● ●●●● ●●●● ●●●●
P <sub>4</sub>				●●				●●	
P <sub>7</sub>					●● ●●				
P <sub>5</sub> , P <sub>6</sub>		●● ●●	●● ●●						

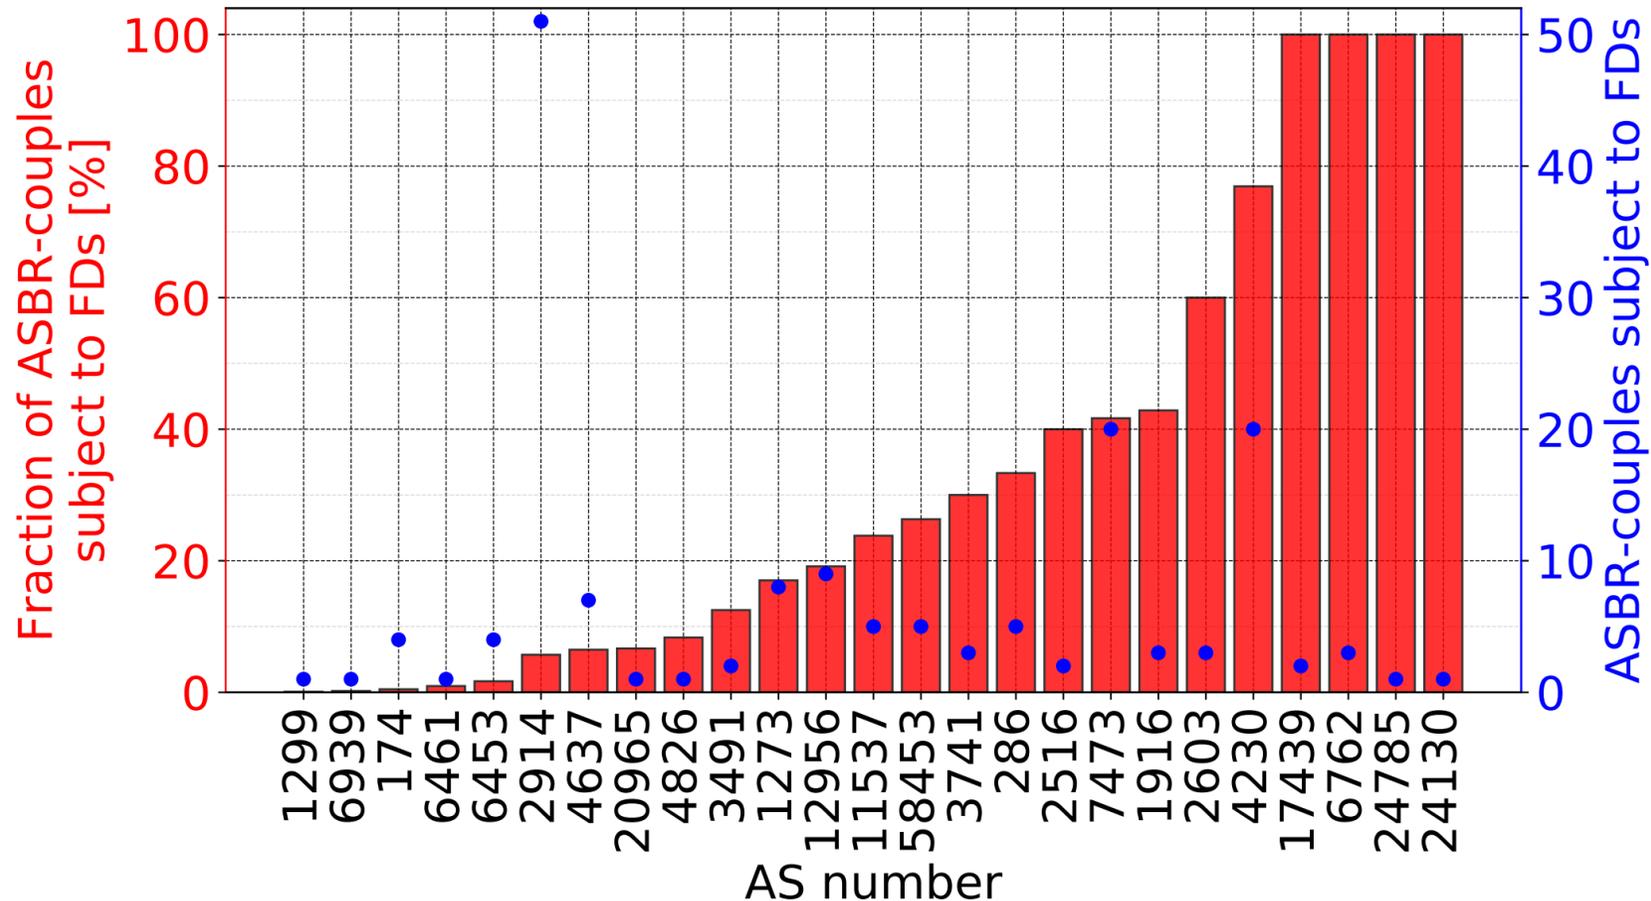

4. Compute #pfxs in each set: (6, 1, 1) and (5, 1, 2) **...we are conservative!**
5. Turn it into proportions: (0.75, 0.125, 0.125) and (0.625, 0.125, 0.25)
6. Compute the *n* number of sets ... in this case *n* = 3 for both examples...
7. Conclude that FDs occur if LB is associated to less than  $\frac{1}{n} = 0.33$  pfxs...

0.33 < 0.75 ... no FDs and 0.33 > 0.25 ... there are FDs

# Results

# In the wild, FDs are a thing!

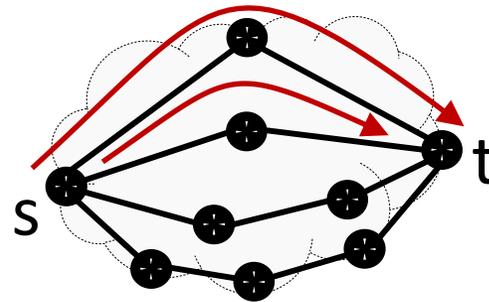

- We measure from 100 VPs
- We look for FDs between AS border routers (ASBRs) and request #pfxs > 100
- We find FDs in 25/54 Ases, with an heterogeneous distribution

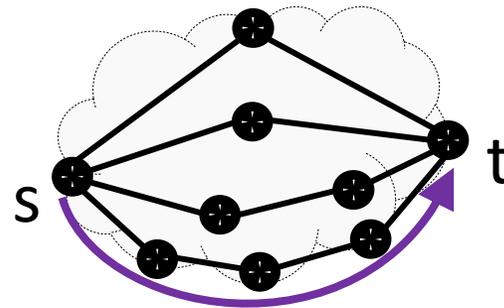

# Digging into the results: a binary pattern

- According to the FDs we found, all traffic detours or none does

		LB	Routes

	$P_4$					
	$P_7$					

# Conclusions

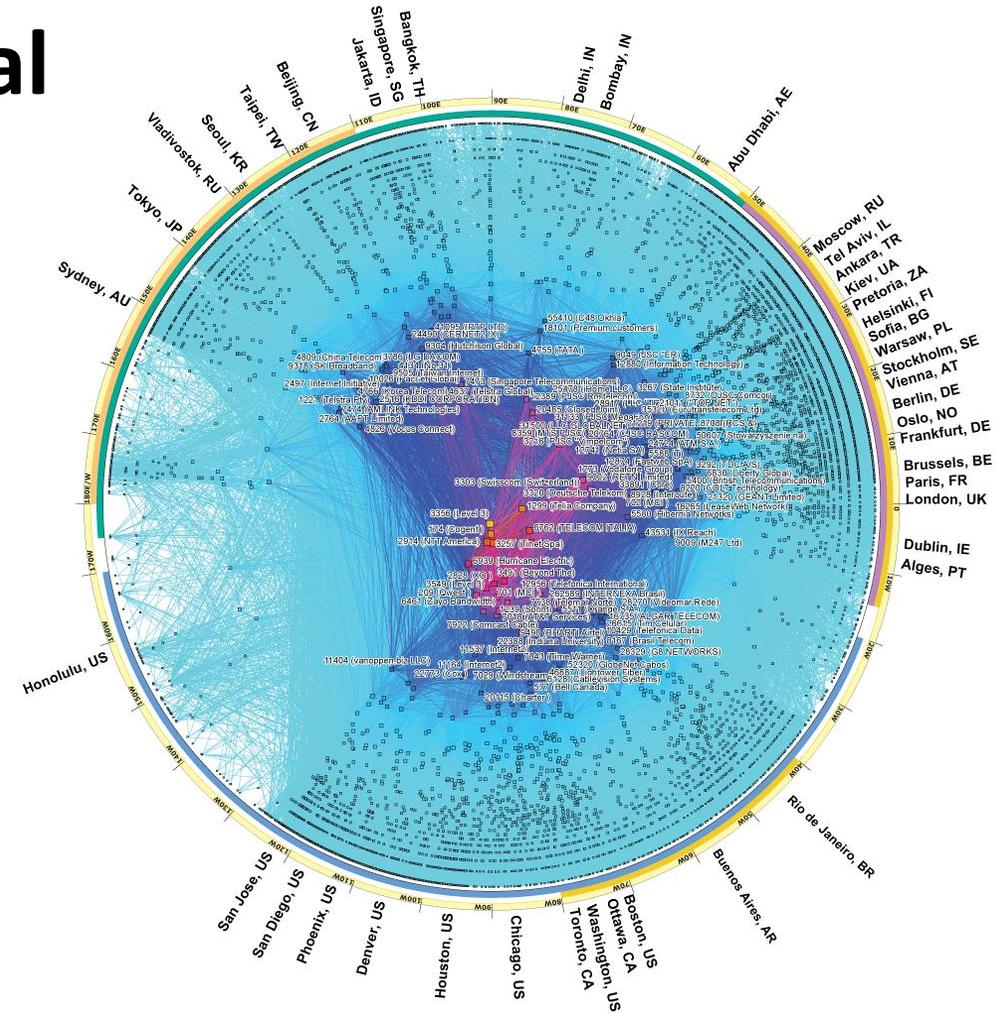

- ❖ Routing inconsistencies produce FDs
- ❖ First methodology to systematically detect FDs
- ❖ We built the first FD-detector and run measurements
- ❖ FDs exist, distribute heterogeneously and have a binary pattern

# Outline

- Background, Research Goal and Questions
- Part I. Filtering the noise to reveal BGP lies
- Part II. Success and Failure of IXPs in Latin America
- Part III. The Art of Detecting Forwarding Detours
- **Conclusions and Future Work**

# Research Goal

- Any system may have broken pieces
  - Problems, errors, limitations, etc...
- The Internet is a complex system
  - Protocols, facilities, networks
  - Hardware, software
  - Network operators, people
- The Internet is “big”...
  - Composed of 70K ASes
  - Point of observation matters

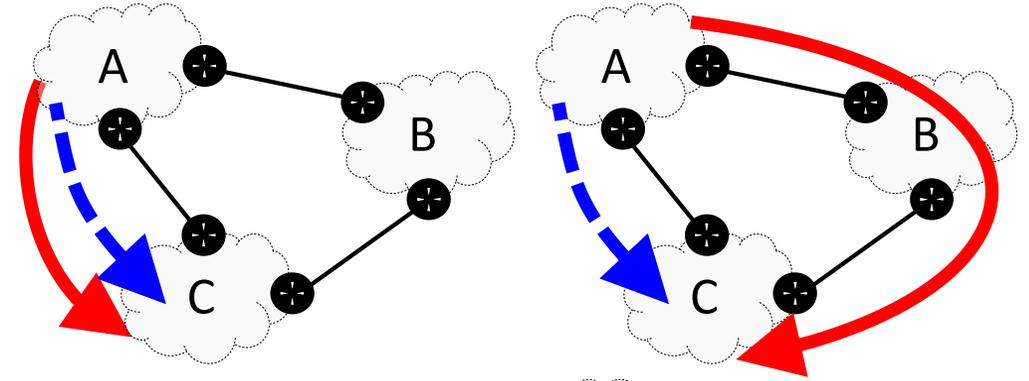

**Research Goal: Detecting Hidden Broken Pieces of The Internet**

# Research Questions...and answers!

Q1: Can we detect BGP lies?

- Expected != Practice

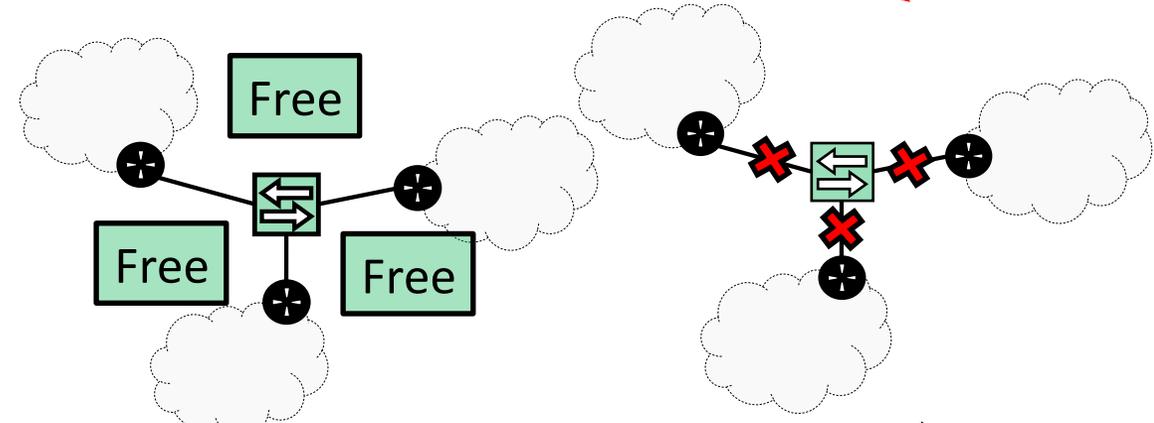

Yes, filtering the noise with our framework

Q2: Are there failed IXPs? Why?

- IXPs with low impact

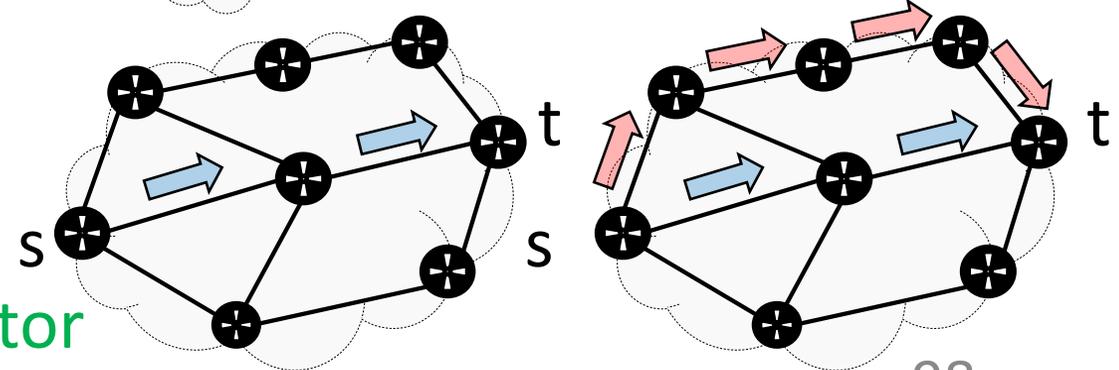

In Latin America, yes. Possibly due to the presence of monopolistic local Ases

Q3: Can we model and detect detours?

- Expected != Practice

Yes<sup>2</sup>: Rles produce them; use our FD-detector

# Publications

## Contribution 1

*Filtering the Noise to Reveal Inter-Domain Lies*

In Network Traffic Measurement and Analysis Conference (TMA) 2019

**Julián M. Del Fiore**, Pascal Merindol, Valerio Persico, Cristel Pelsser and Antonio Pescapè.

## Contribution 2

*A first look at the Latin American IXPs*

In SIGCOMM Computer Communications Review (CCR), January 2020

Esteban Carisimo, **Julián M. Del Fiore**, D. Dujovne, Cristel Pelsser, and J. I. Alvarez-Hamelin

## Contribution 3

*The Art of Detecting Forwarding Detours*

Minor revision in IEEE Transactions on Network and Service Management (IEEE TNSM) 2021

**Julián M. Del Fiore**, Valerio Persico, Pascal Merindol, Cristel Pelsser and Antonio Pescapè.

# Future Work

# Short term: enlarging the measurements

- We used 8 co-located VPs to detect BGP lies
- Our study of IXPs relied on BGP data
- New contributions:
  1. Use co-located VPs placed in IXPs
  2. Run active measurements for the IXPs work

# Medium term: digging more into FDs

- Currently, we focus on the detection of FDs
- New contributions:
  1. Detect the router introducing the FA leading to a FD
  2. Measuring impact of FDs on performance
  3. Building an FD-detector-lite leveraging (2)

# Long term: topology discovery and LB studies

- The multipath discovery algorithm (MDA):
  - Discovers multi-path routing patterns
  - Probing cost updated following a mathematical model
  - Measurements on a per-prefix basis
  - Campaigns usually comprise multiple destinations
- New contributions:
  1. Two step measurement process (Topology Feedback, TF-MDA)
  2. Add network knowledge to probing model (Bayesian-MDA)
  3. Combine the ideas of (1) and (2) (Ultimate, U-MDA)

**Thank you for your attention**

**Questions ?**

# Complementary Slides

You told me the  
Internet was perfect!

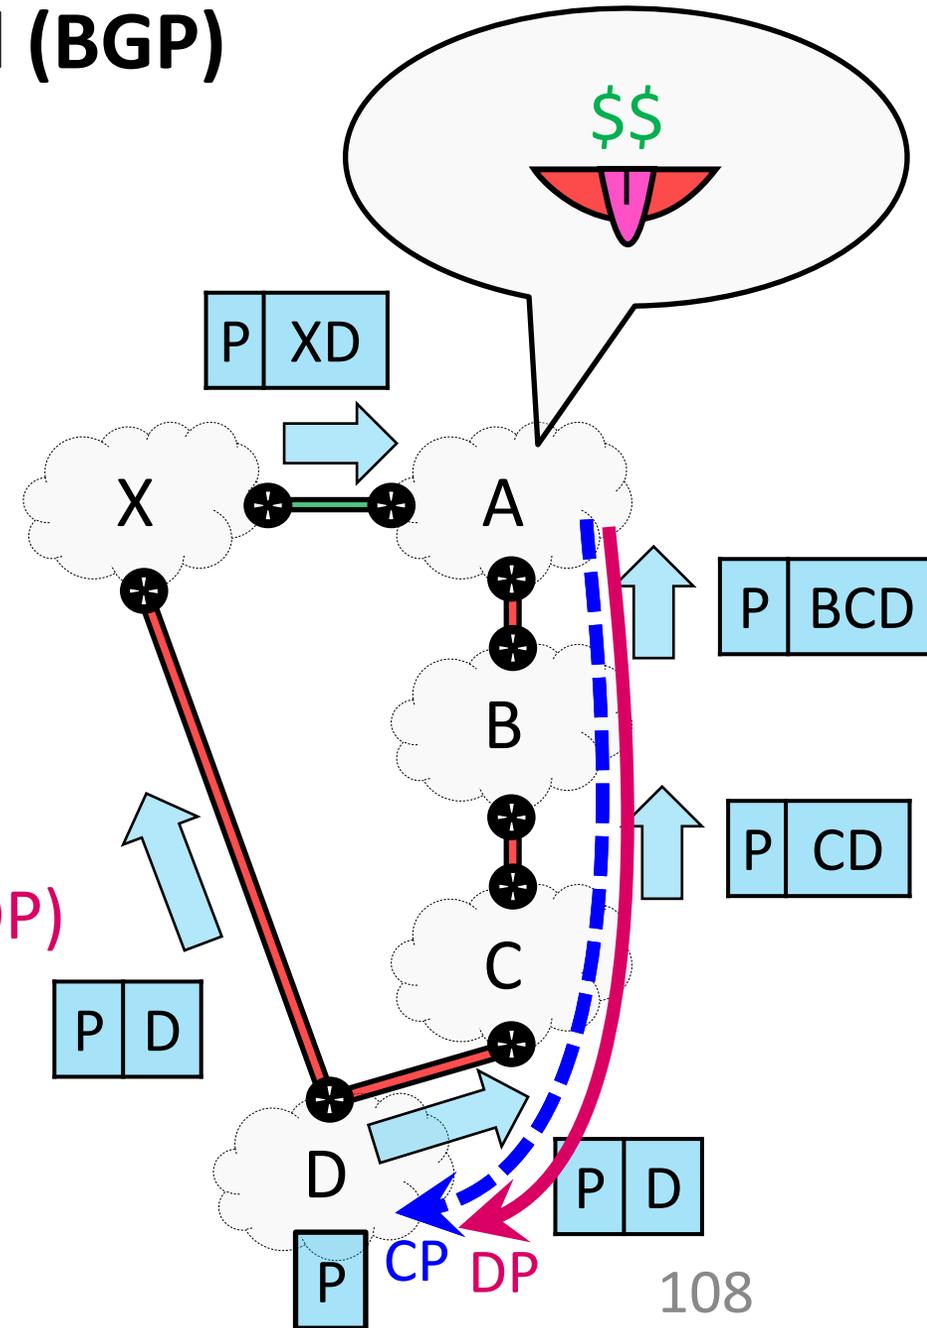

Yeah, in my dreams

# **BGP: Extended Background**

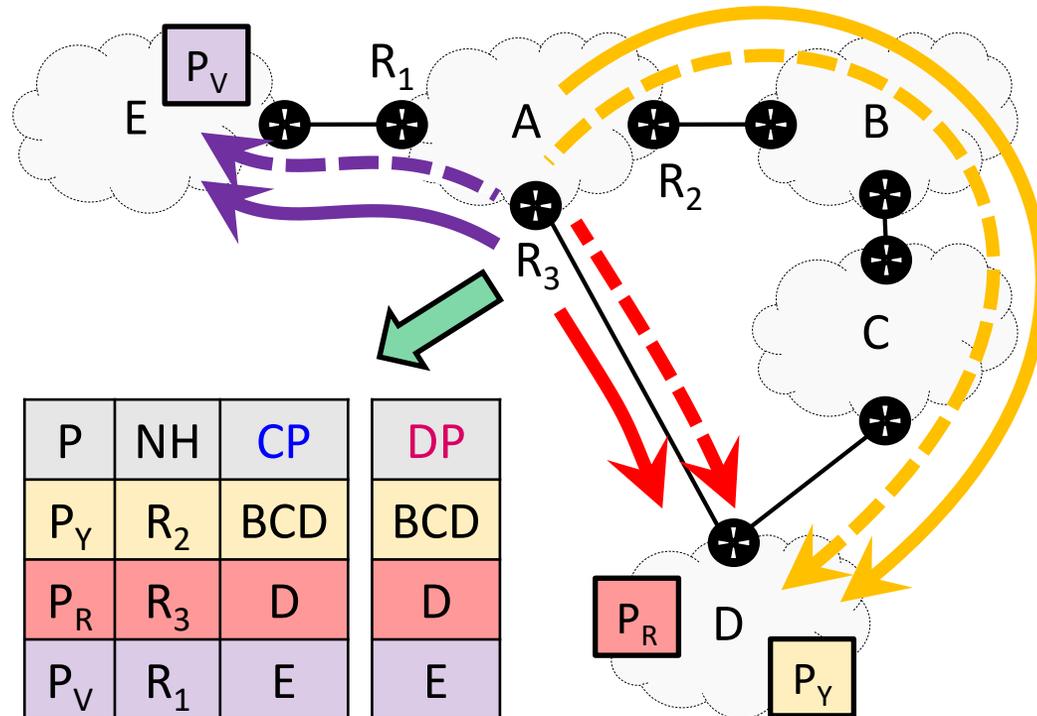

# Border Gateway Protocol (BGP)

- Announce the IP prefixes they own
- Relay announcements updating the messages
- Decision process to choose the best path
- Resulting AS-path as the **control path (CP)**
- Packets flow towards P through a **data path (DP)**

# Border Gateway Protocol (BGP)

- BGP is run by routers called BGP speakers
- For each external IP prefix (P):
  - the next-hop (NH) to be reached
  - the **control path (CP)** that should **theoretically** be followed
- The **data path (DP)** is the path used in **practice**

# **Detecting BGP lies**

## **Technical considerations**

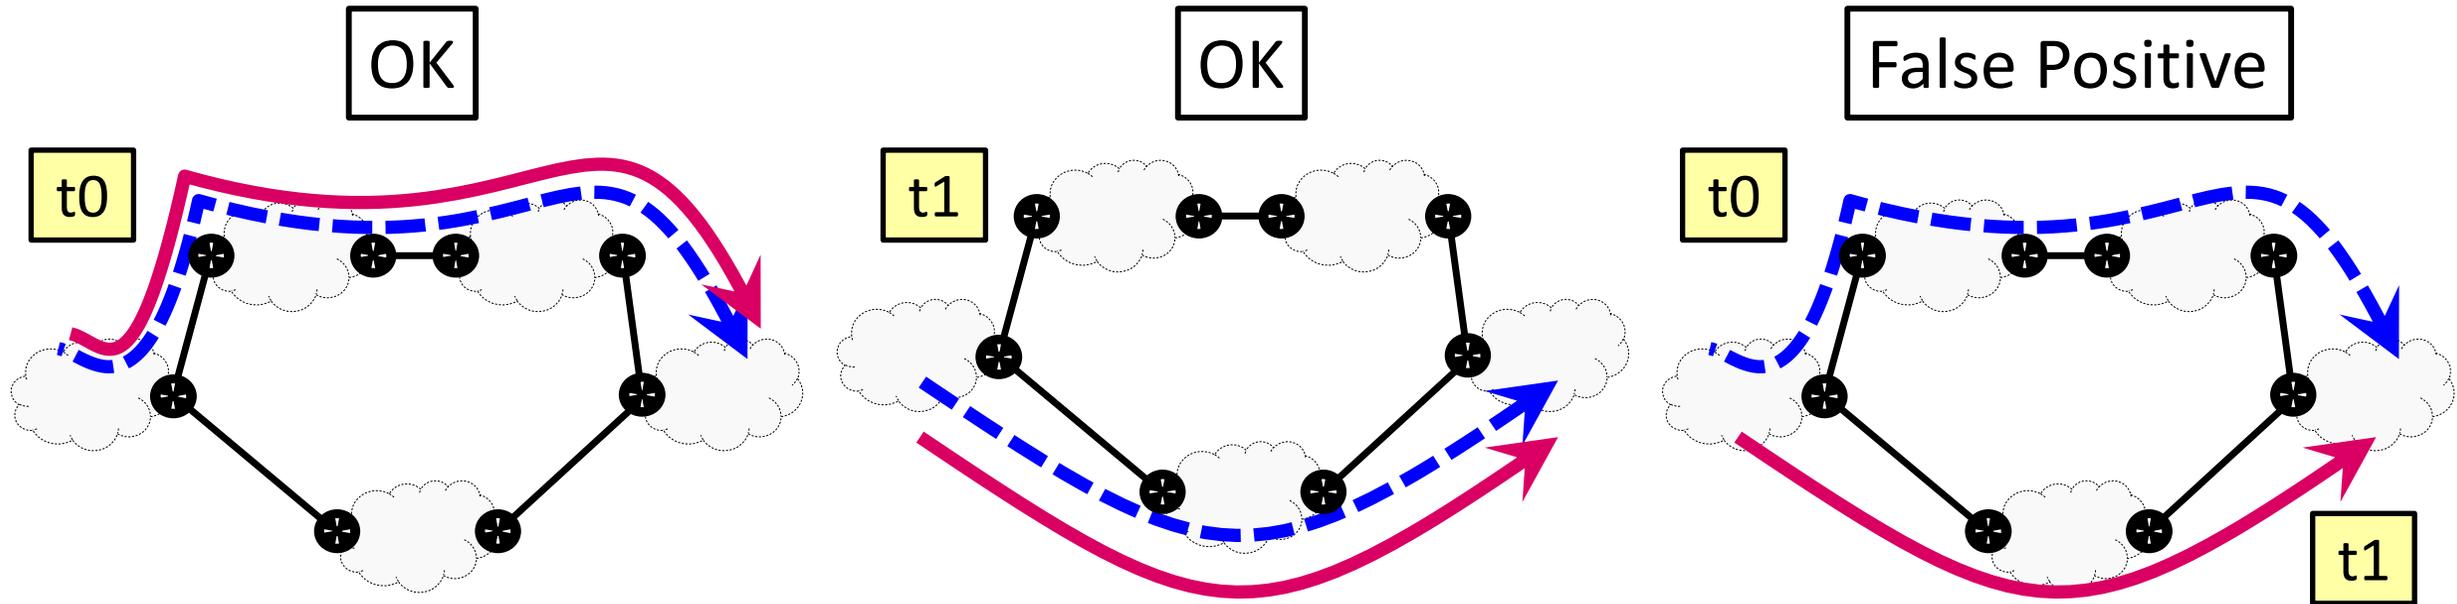

# Address space synchronization

- After the measurements, we have a “bag” of **CPs** and **DPs**
- Question...which **DP** should be compared with which **CP**?
- Each **DP** is associated with a given destination  $d$
- Compare **DP** with the **CP** of the longest matching prefix

P	NH	CP	DP
$P_Y$	$R_2$	BCD	BCD
$P_R$	$R_3$	D	D
$P_V$	$R_1$	E	E

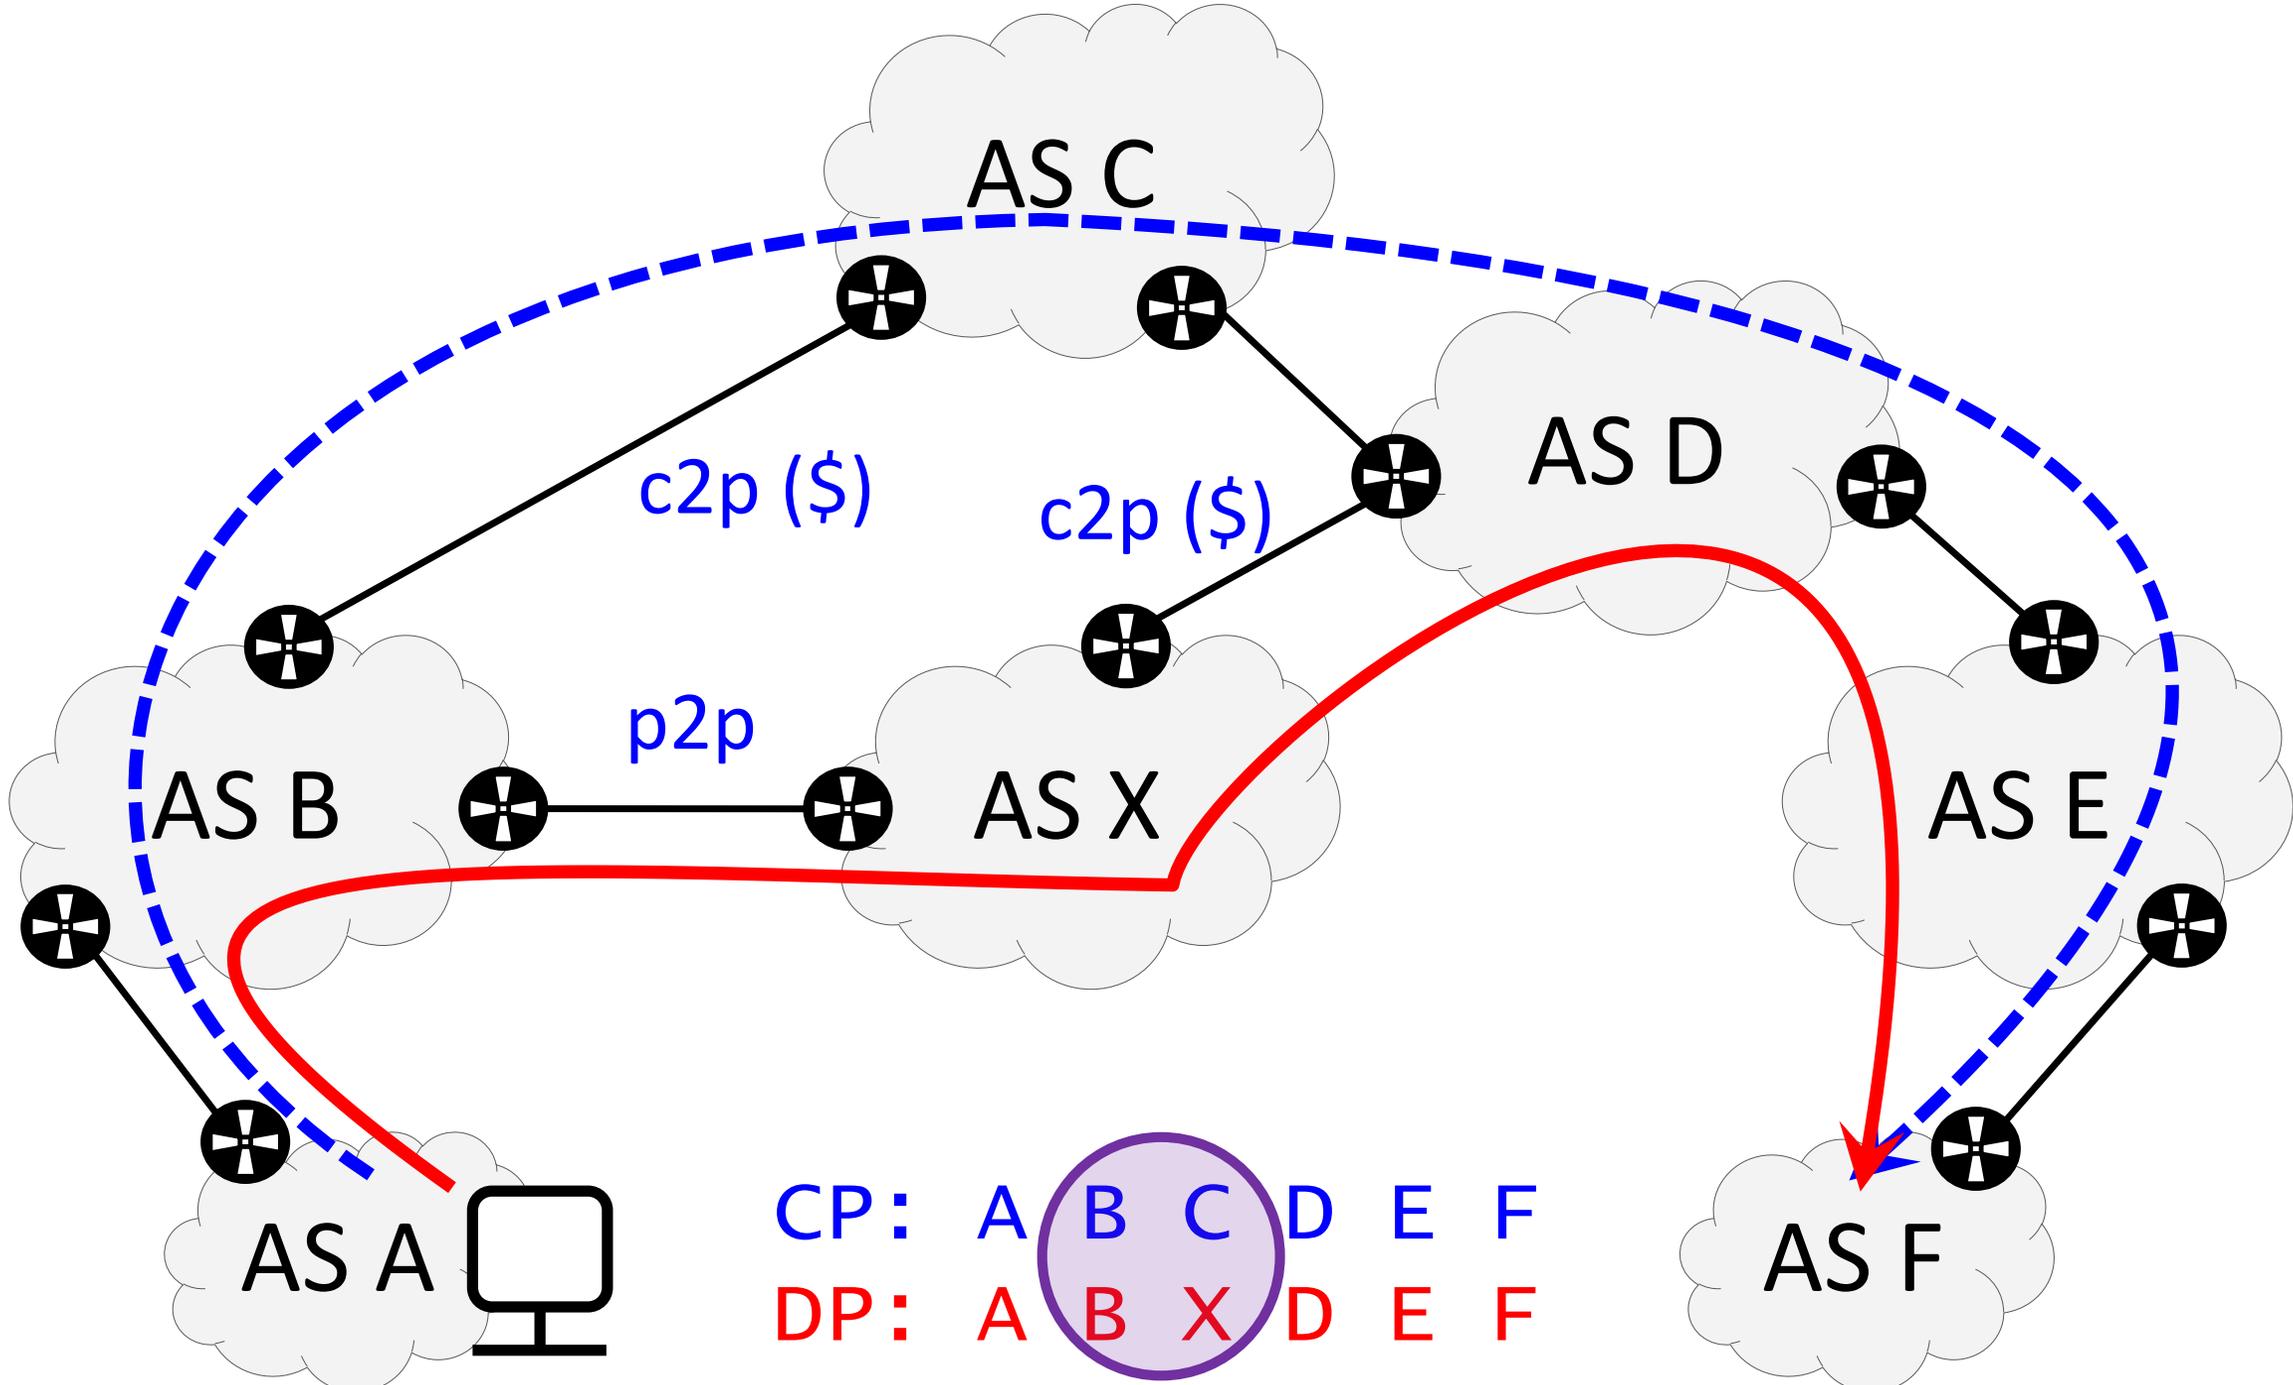

# Time-synchronization

- The CP is not static, at t0 and t1 it may be different
- Imagine no BGP lies occur...then the DP also changes over time!
- To avoid false positives, then CPs and DPs need to be collected “close” in time

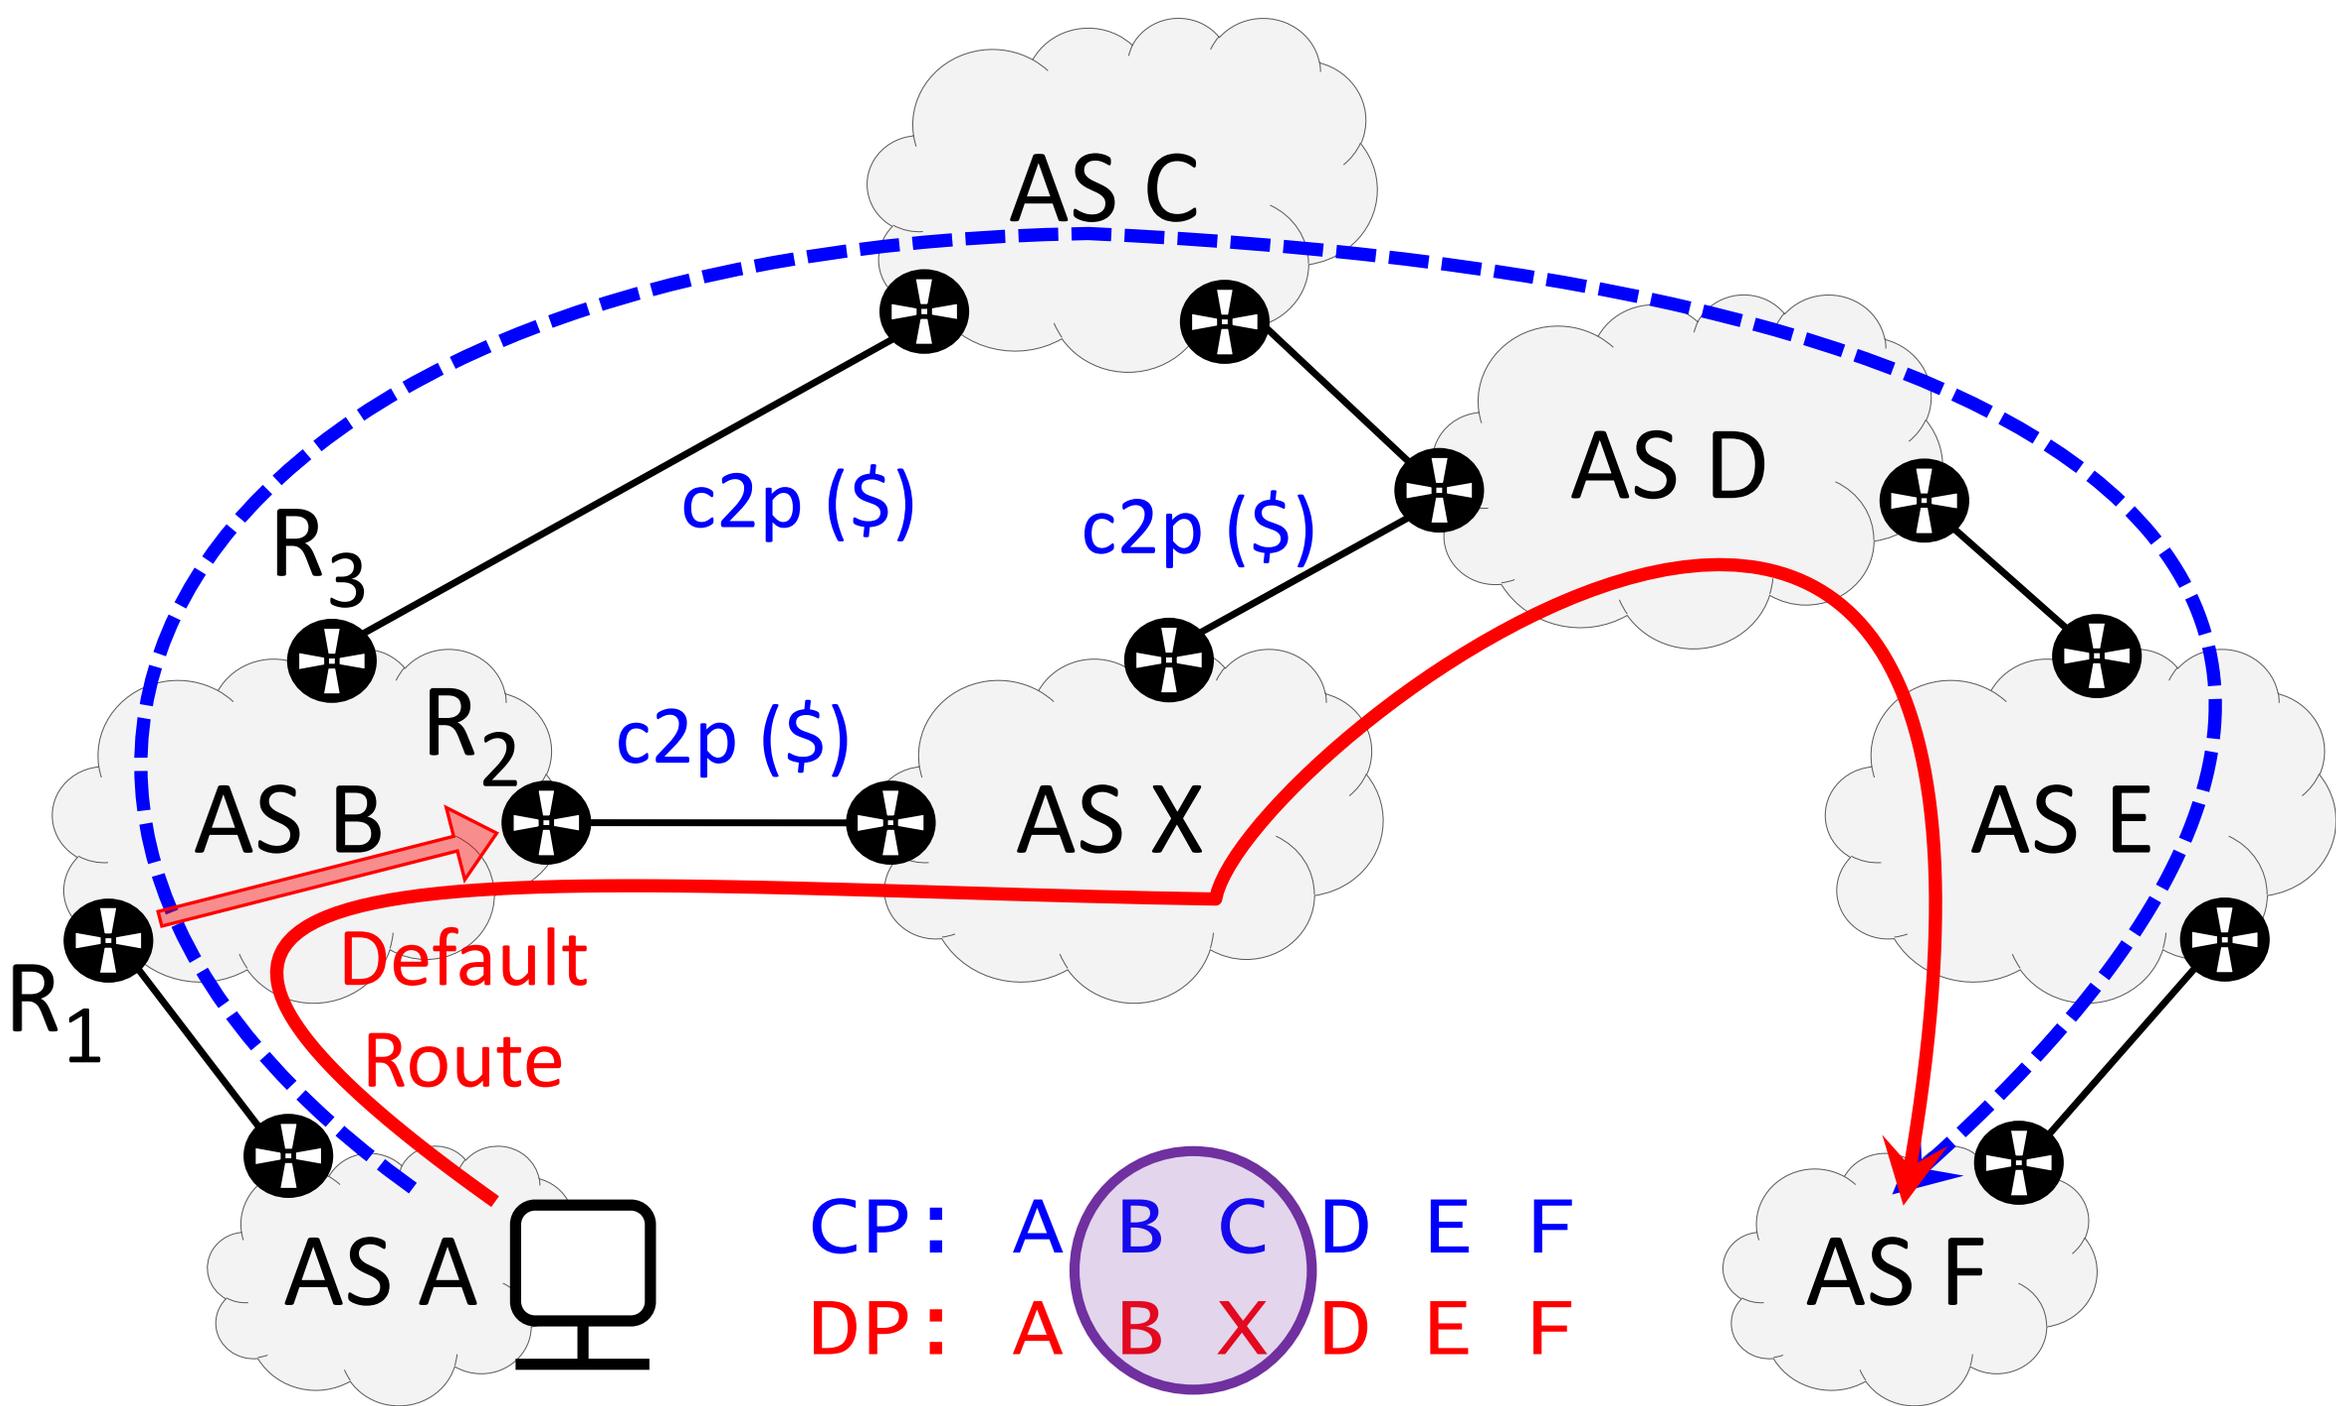

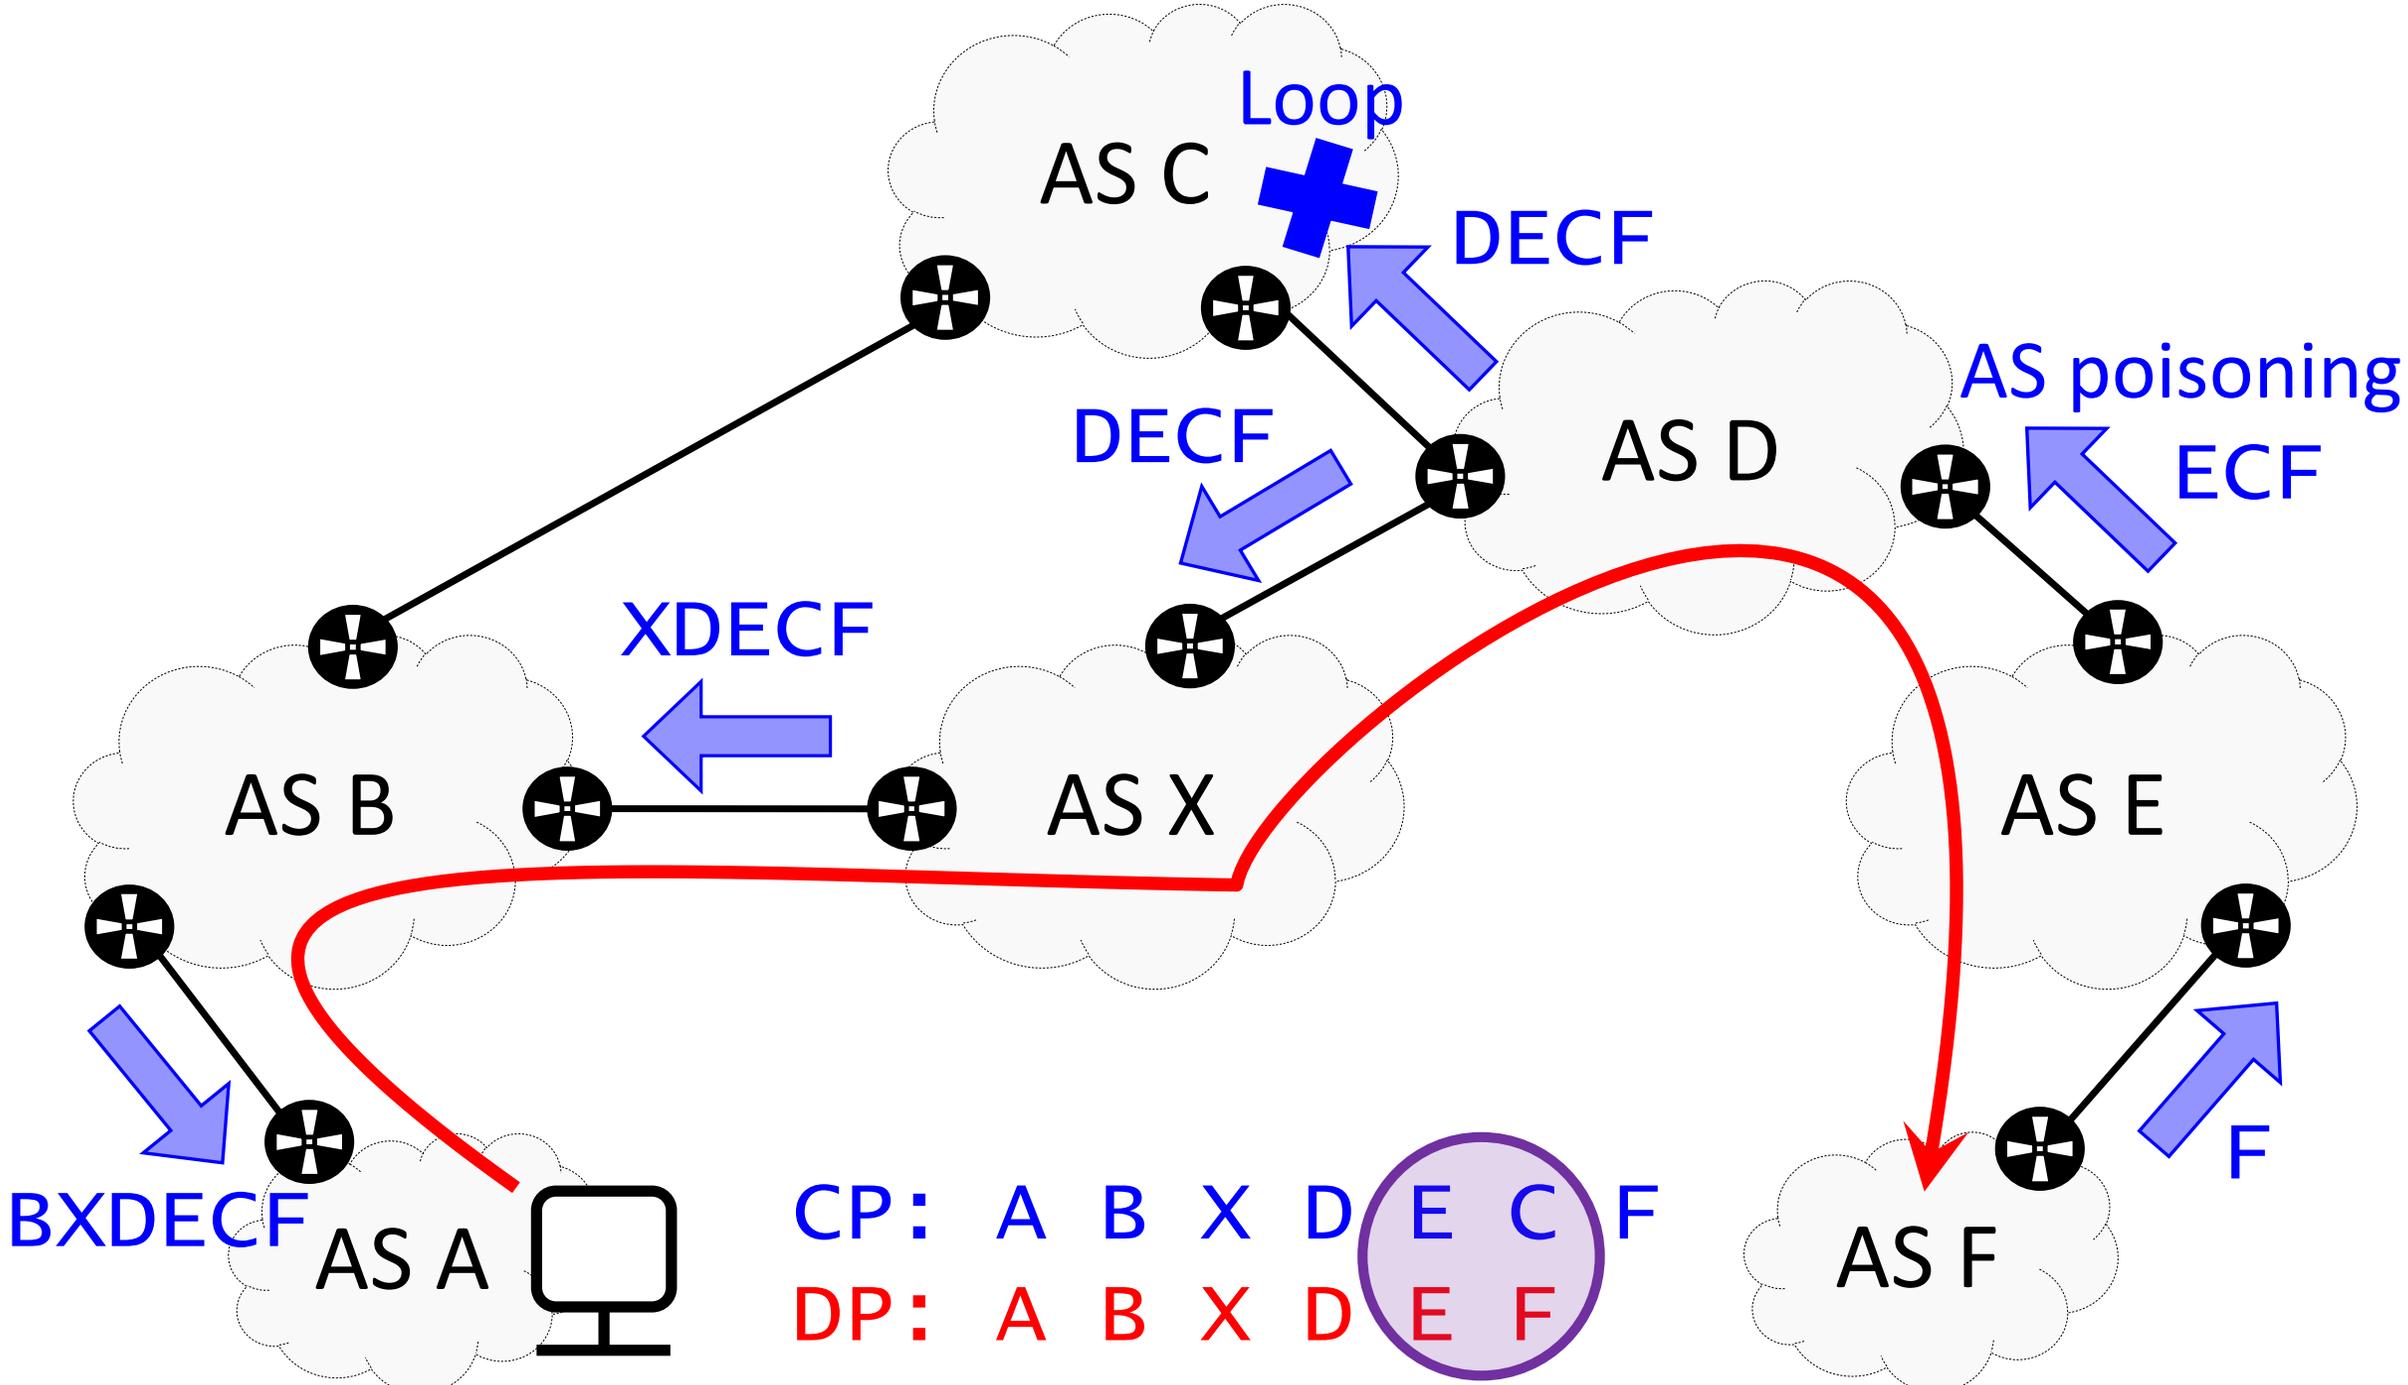

# **BGP lies: examples**

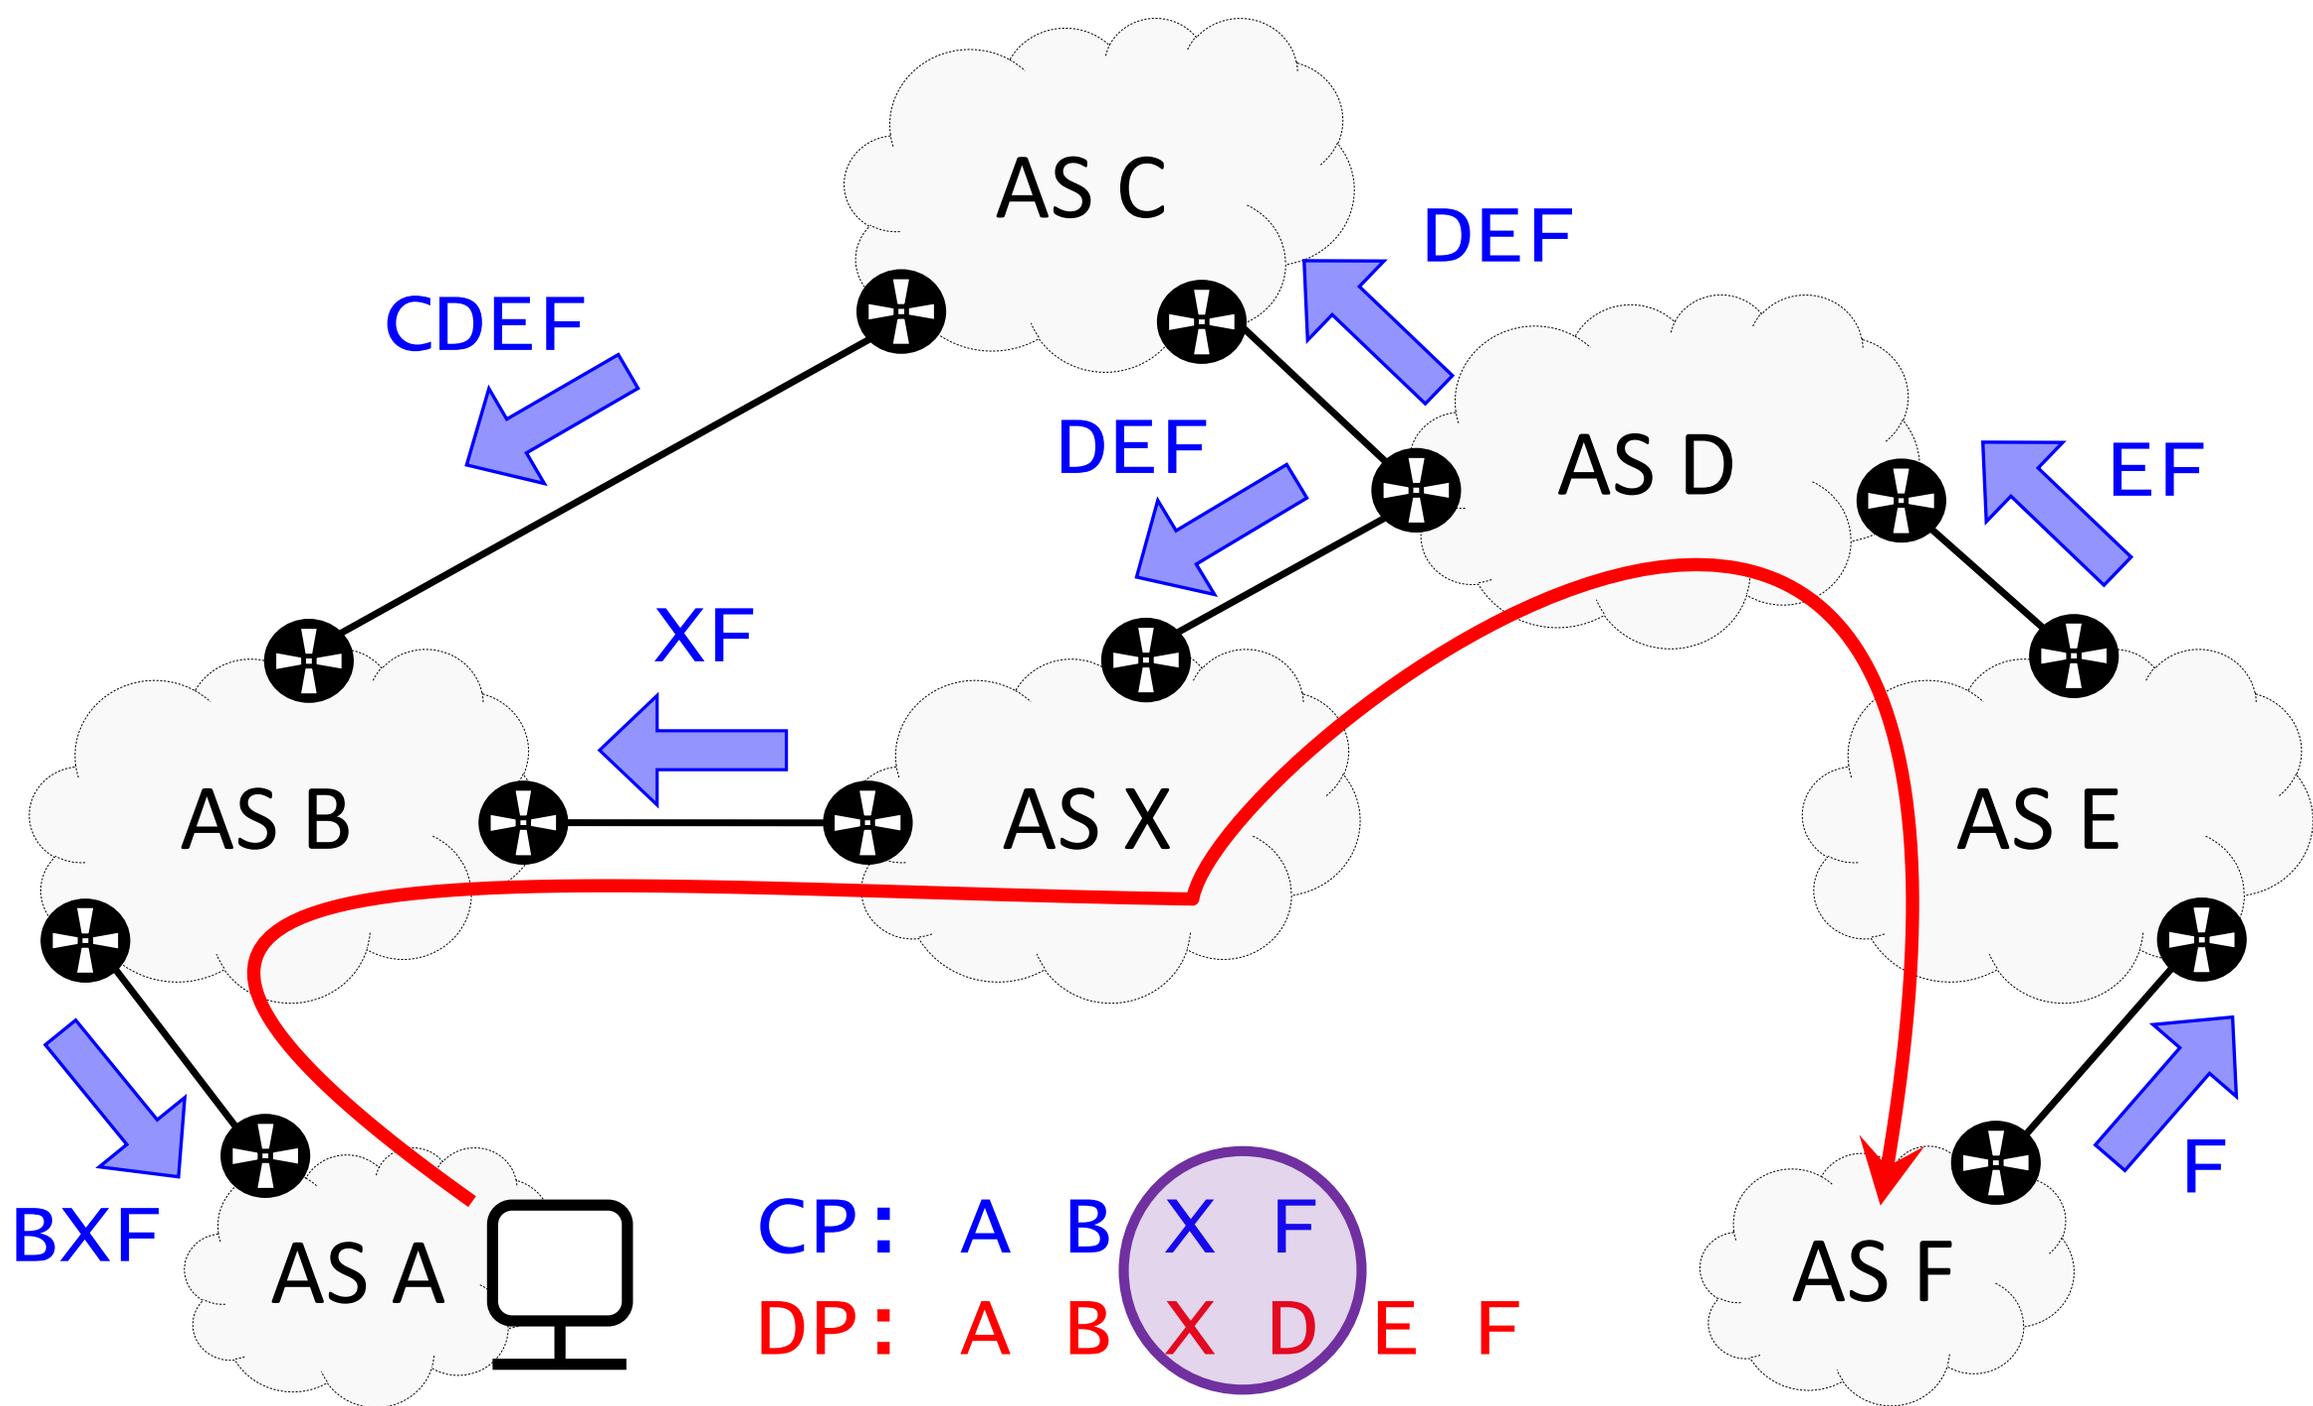

CP: A B C D E F  
 DP: A B X D E F

CP: A B C D E F  
 DP: A B X D E F

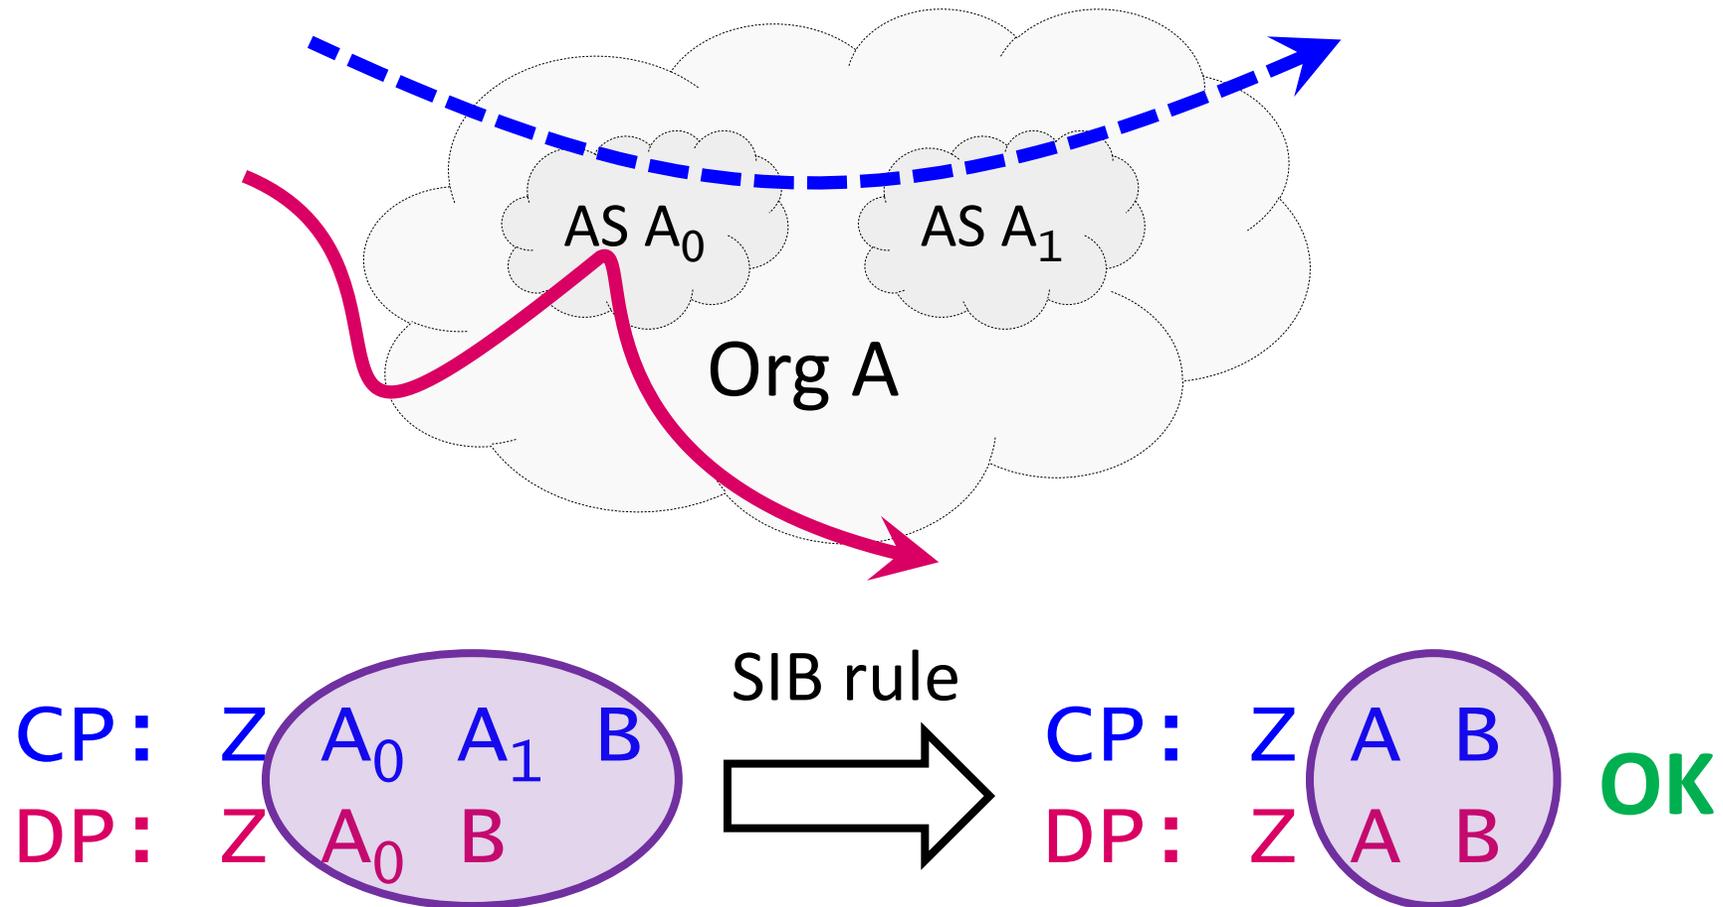

# Framework: Our filters

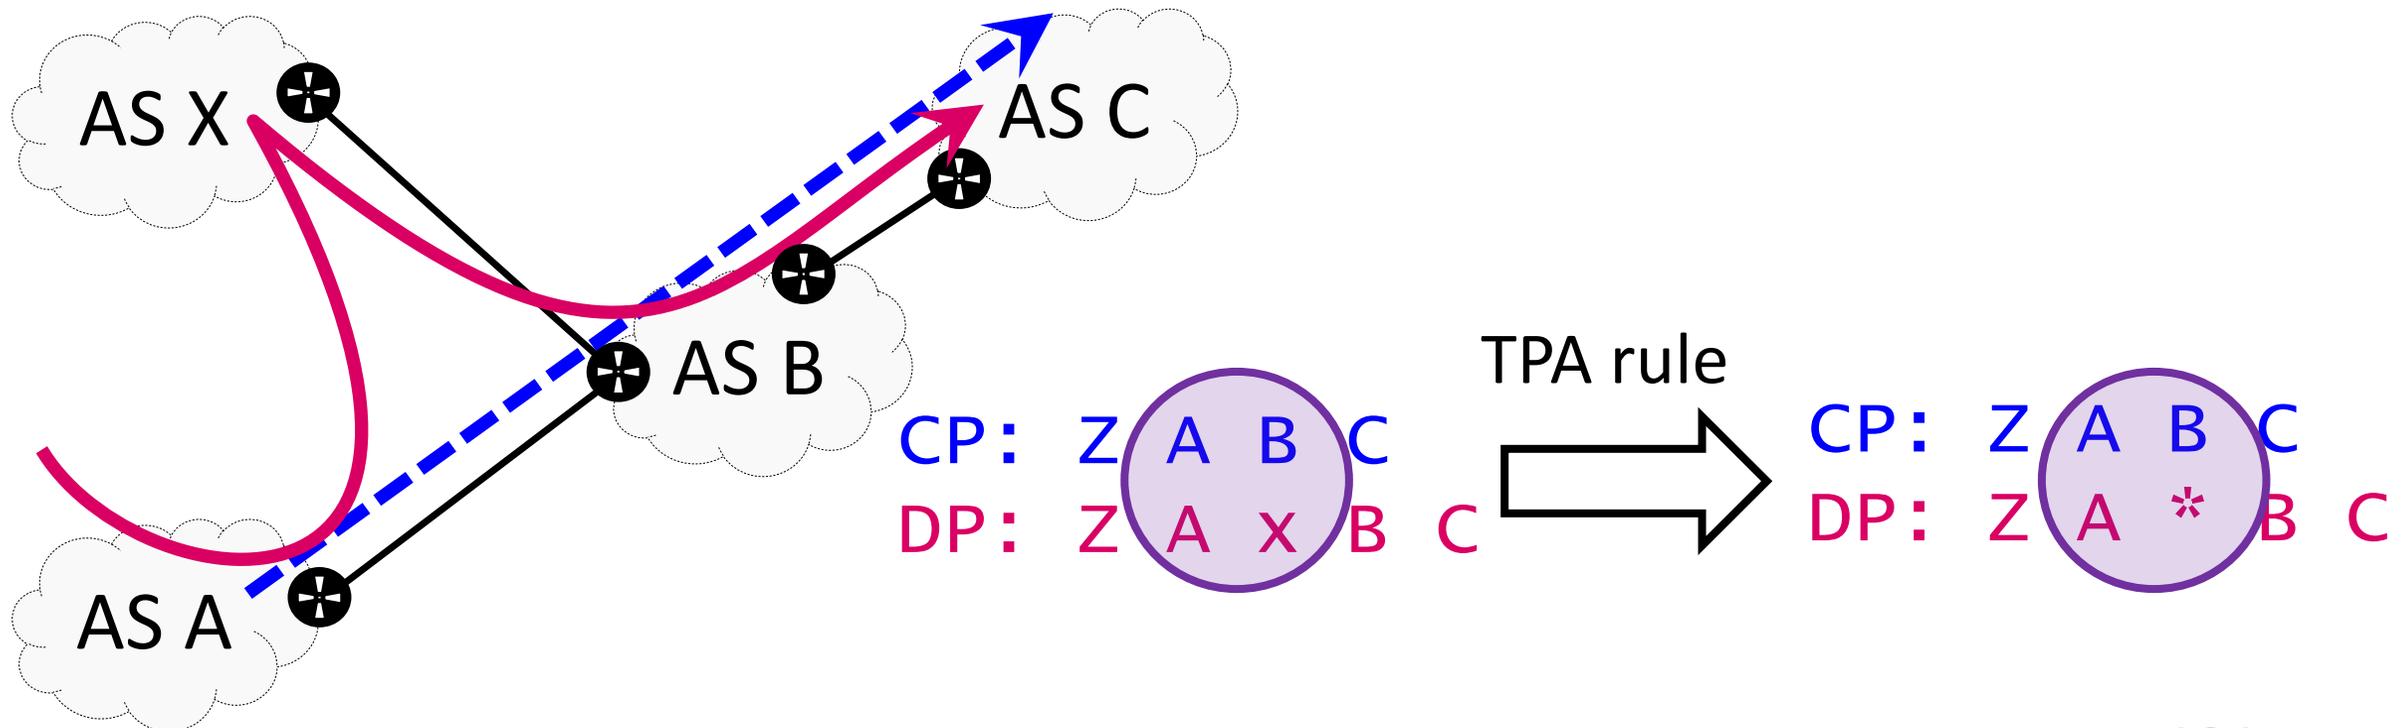

# Mapping relaxation - SIB Rule

- SIB rule: Apply an AS-to-organization mapping
- We construct the mapping with CAIDA's AS Organizations Dataset

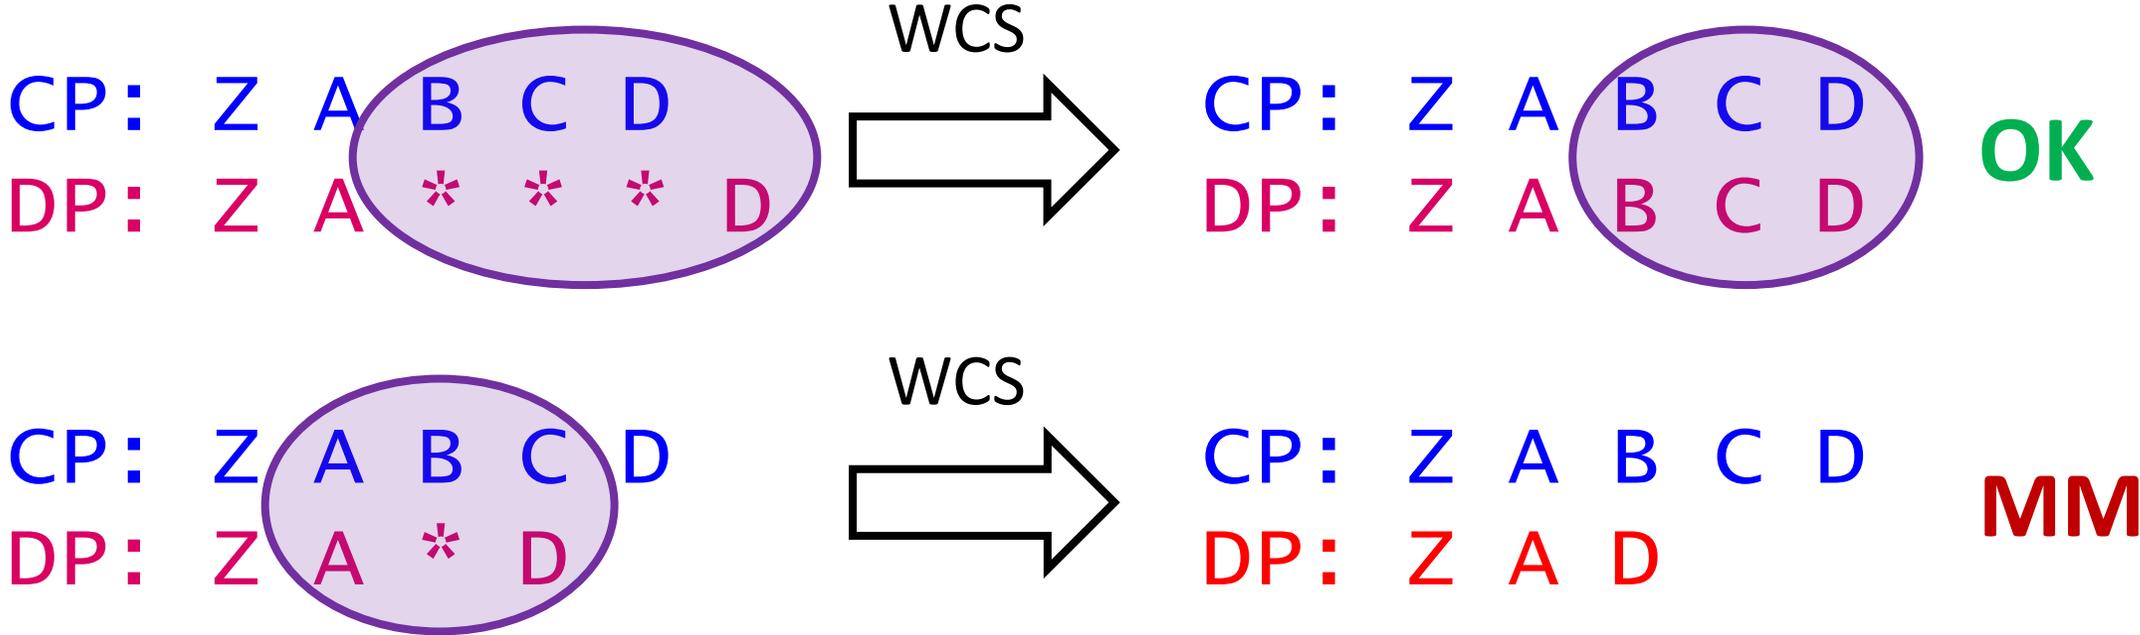

# Mapping relaxation – TPAs Rule

- TPA rules: replace TPAs with wildcards.
- When only one IP maps to an AS, we label it as candidate TPAs (cTAPs)
  - looseTPA: all cTPAs are inferred to be TPAs
  - strictTPA: exclude cTPAs surrounded by cTPAs or missing hops

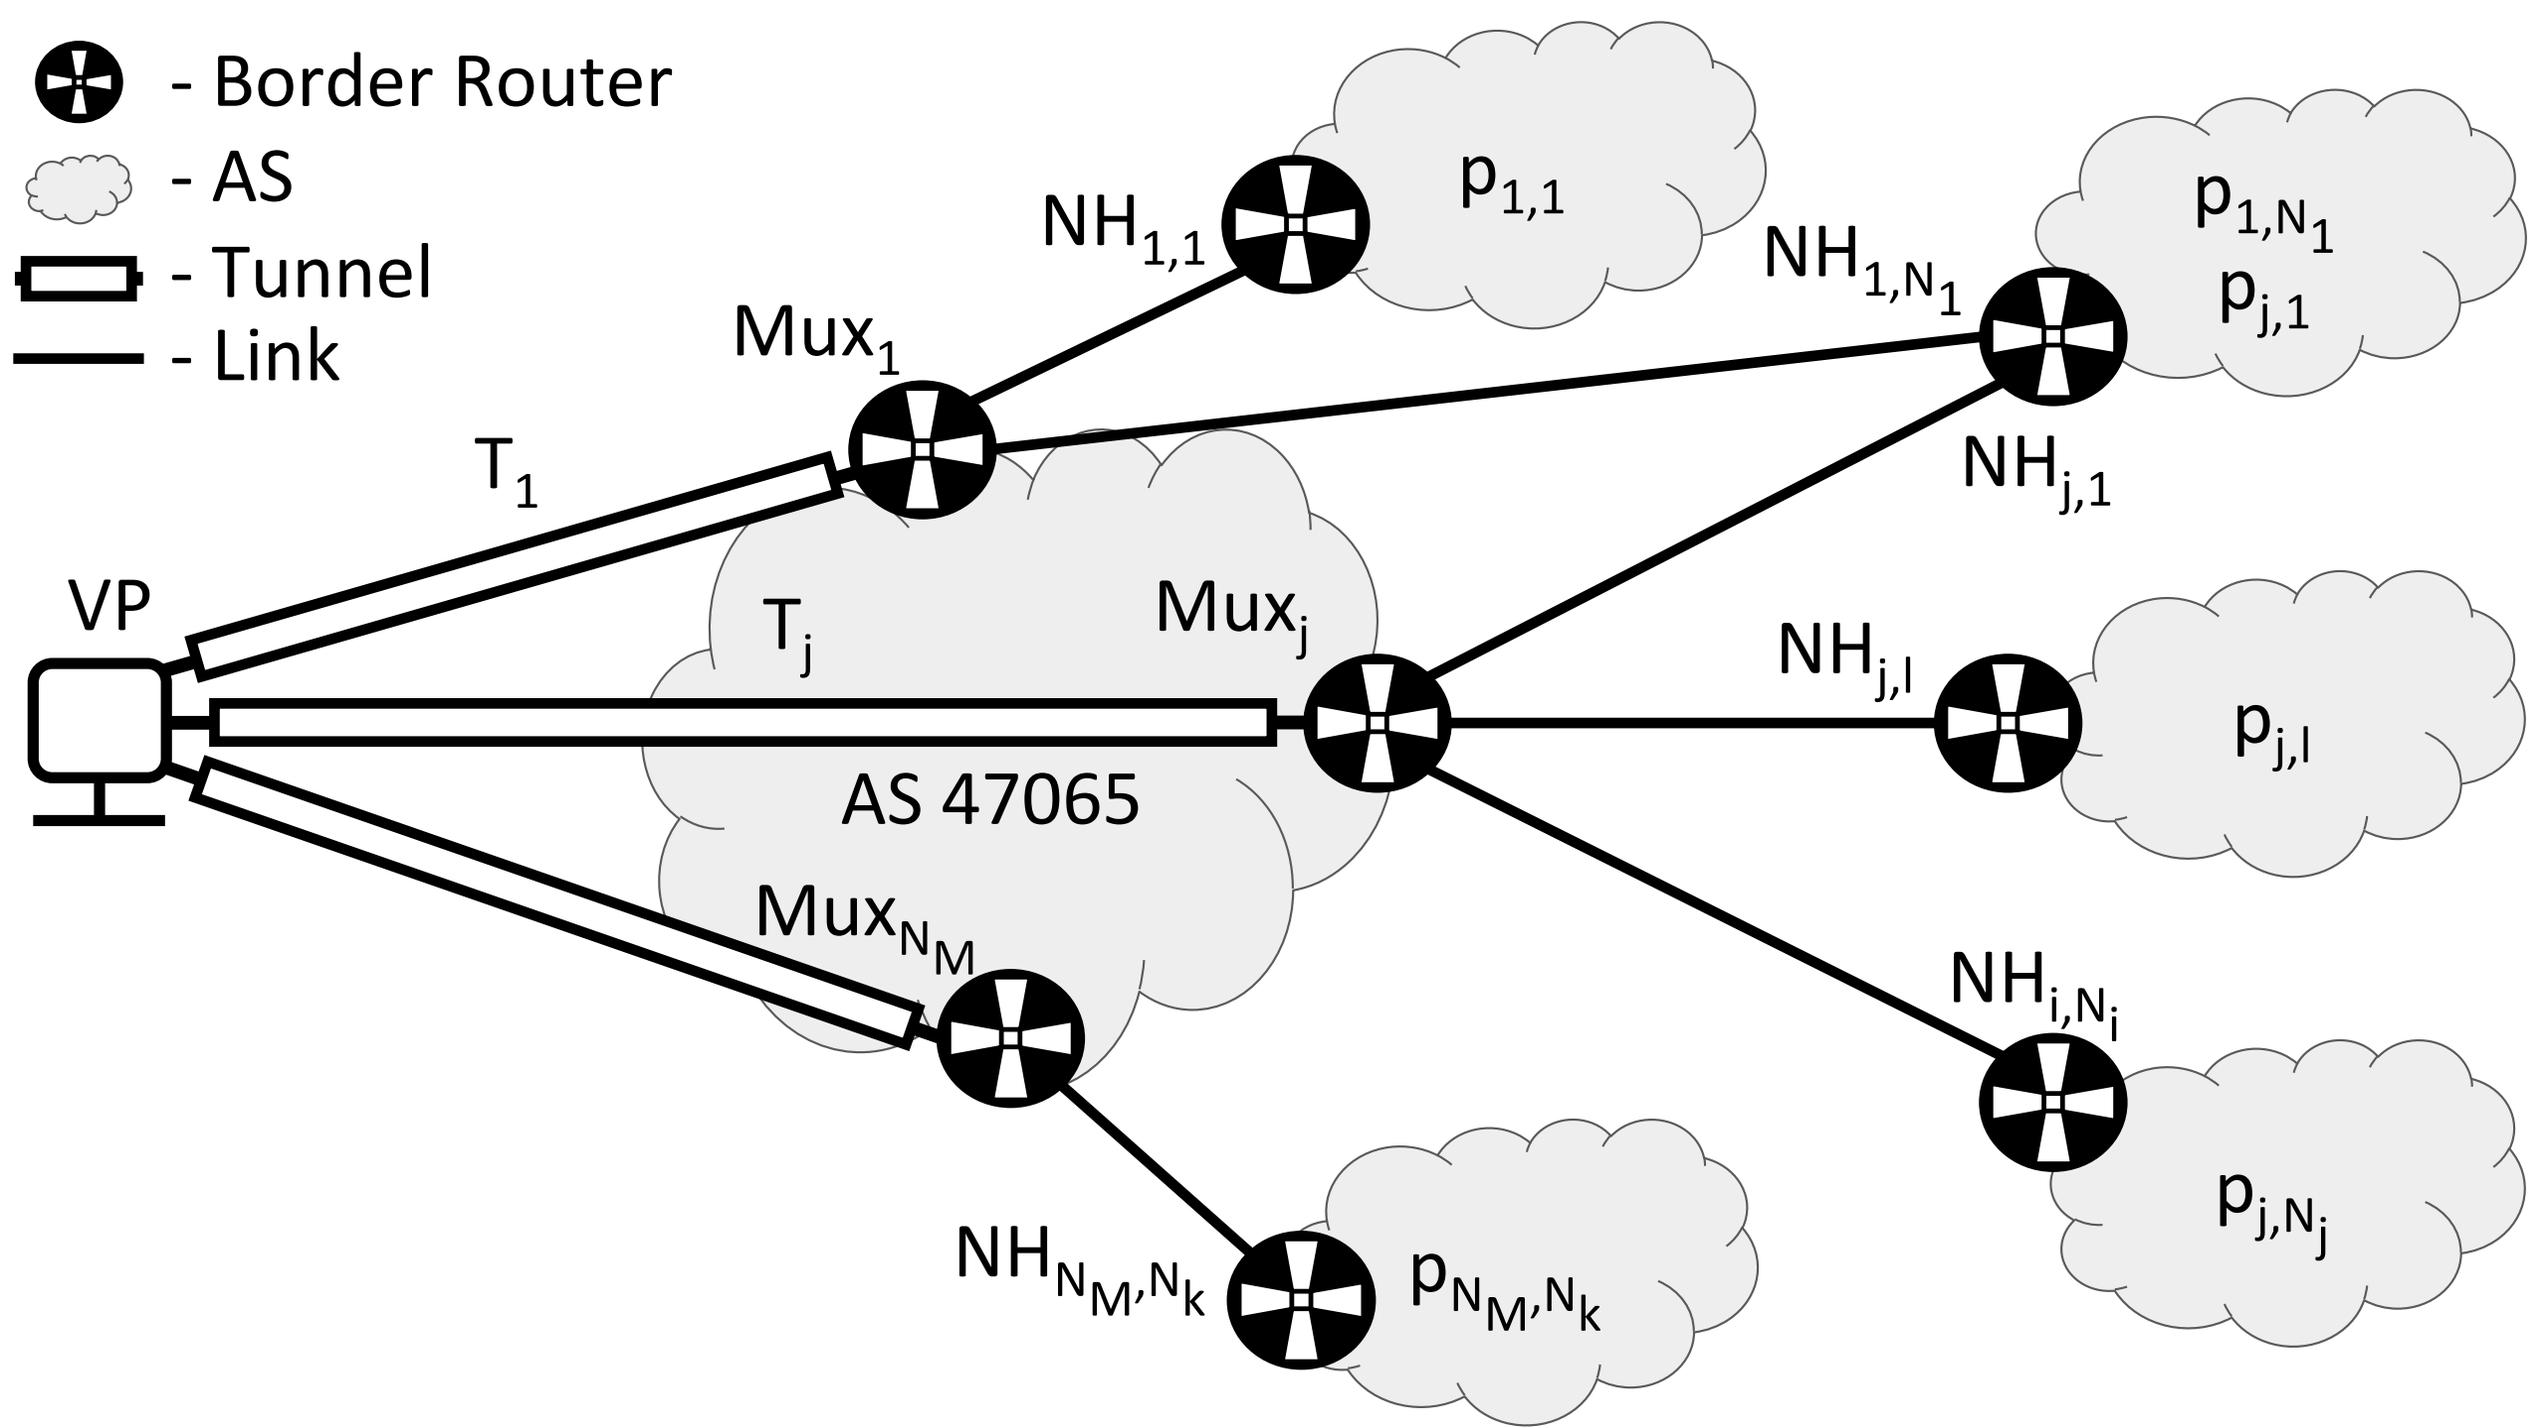

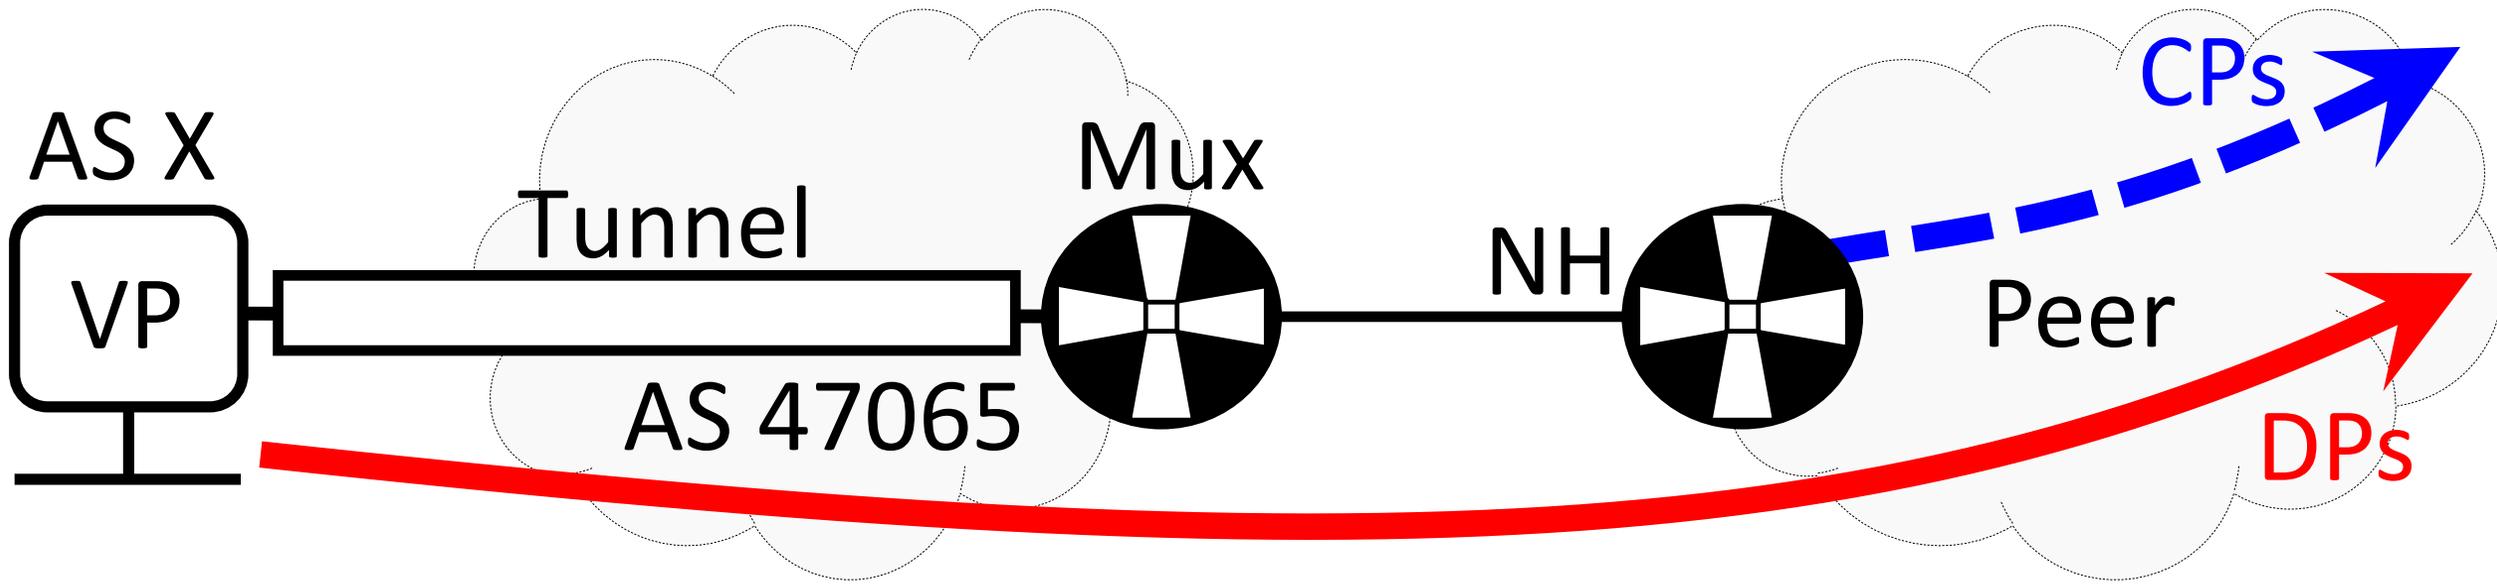

# Wildcards Correction Stage (WCS)

- Try to infer a value for the wildcards and see if paths mismatch (MM)
- Note that wildcards are either missing hops or inferred TPAs.

# Measuring Platform

<b>Peer</b>	<b>Organization</b>	<b>ASN</b>	<b>CP-DP match [%]</b>
<i>isi</i>	Los Nettos	226	77.92

<i>hm2</i>	RGnet, LLC	3130	77.90

# **Modular Framework**

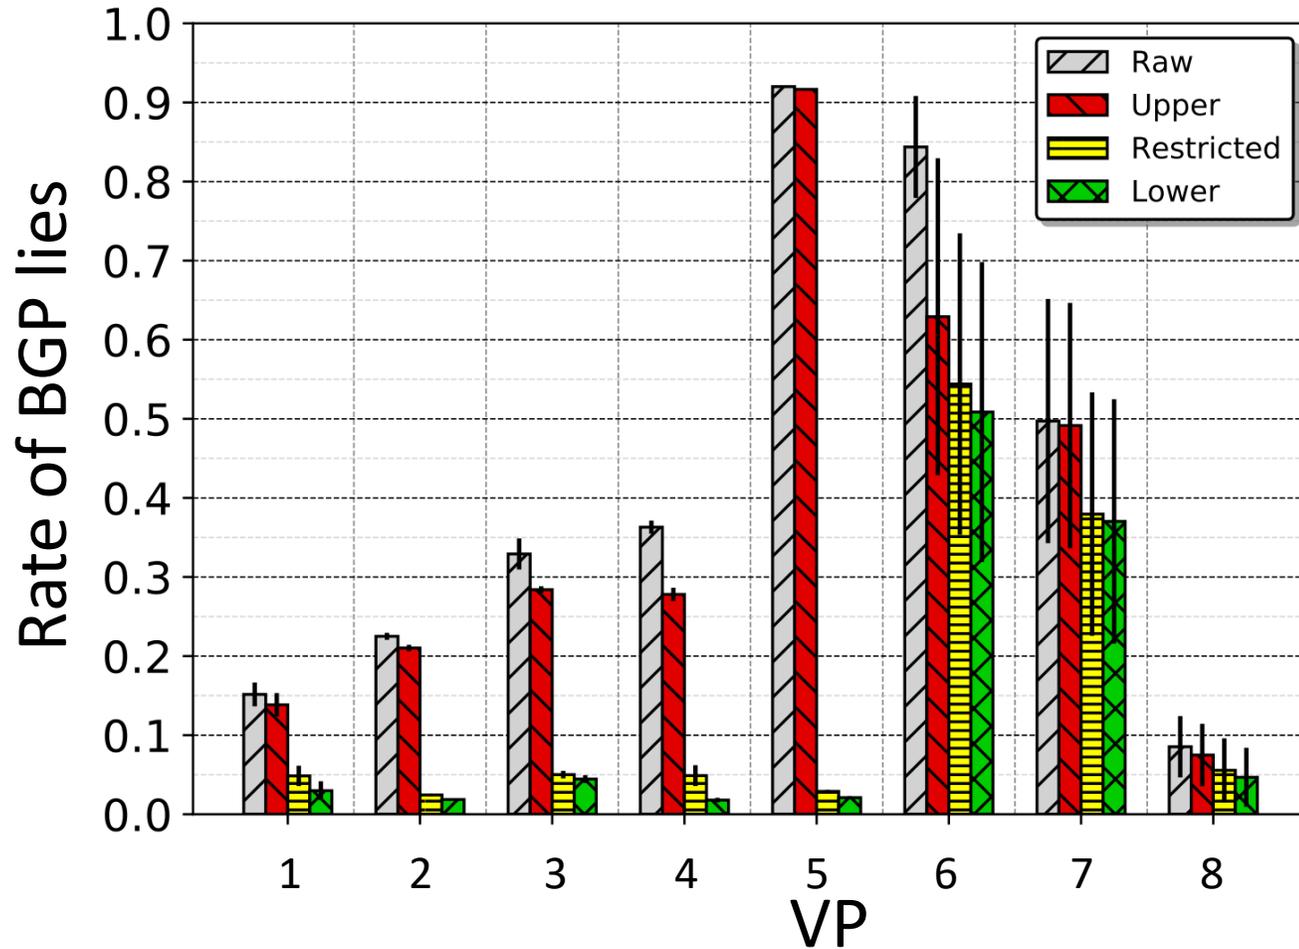

## **Different models, different results**

# Modularity

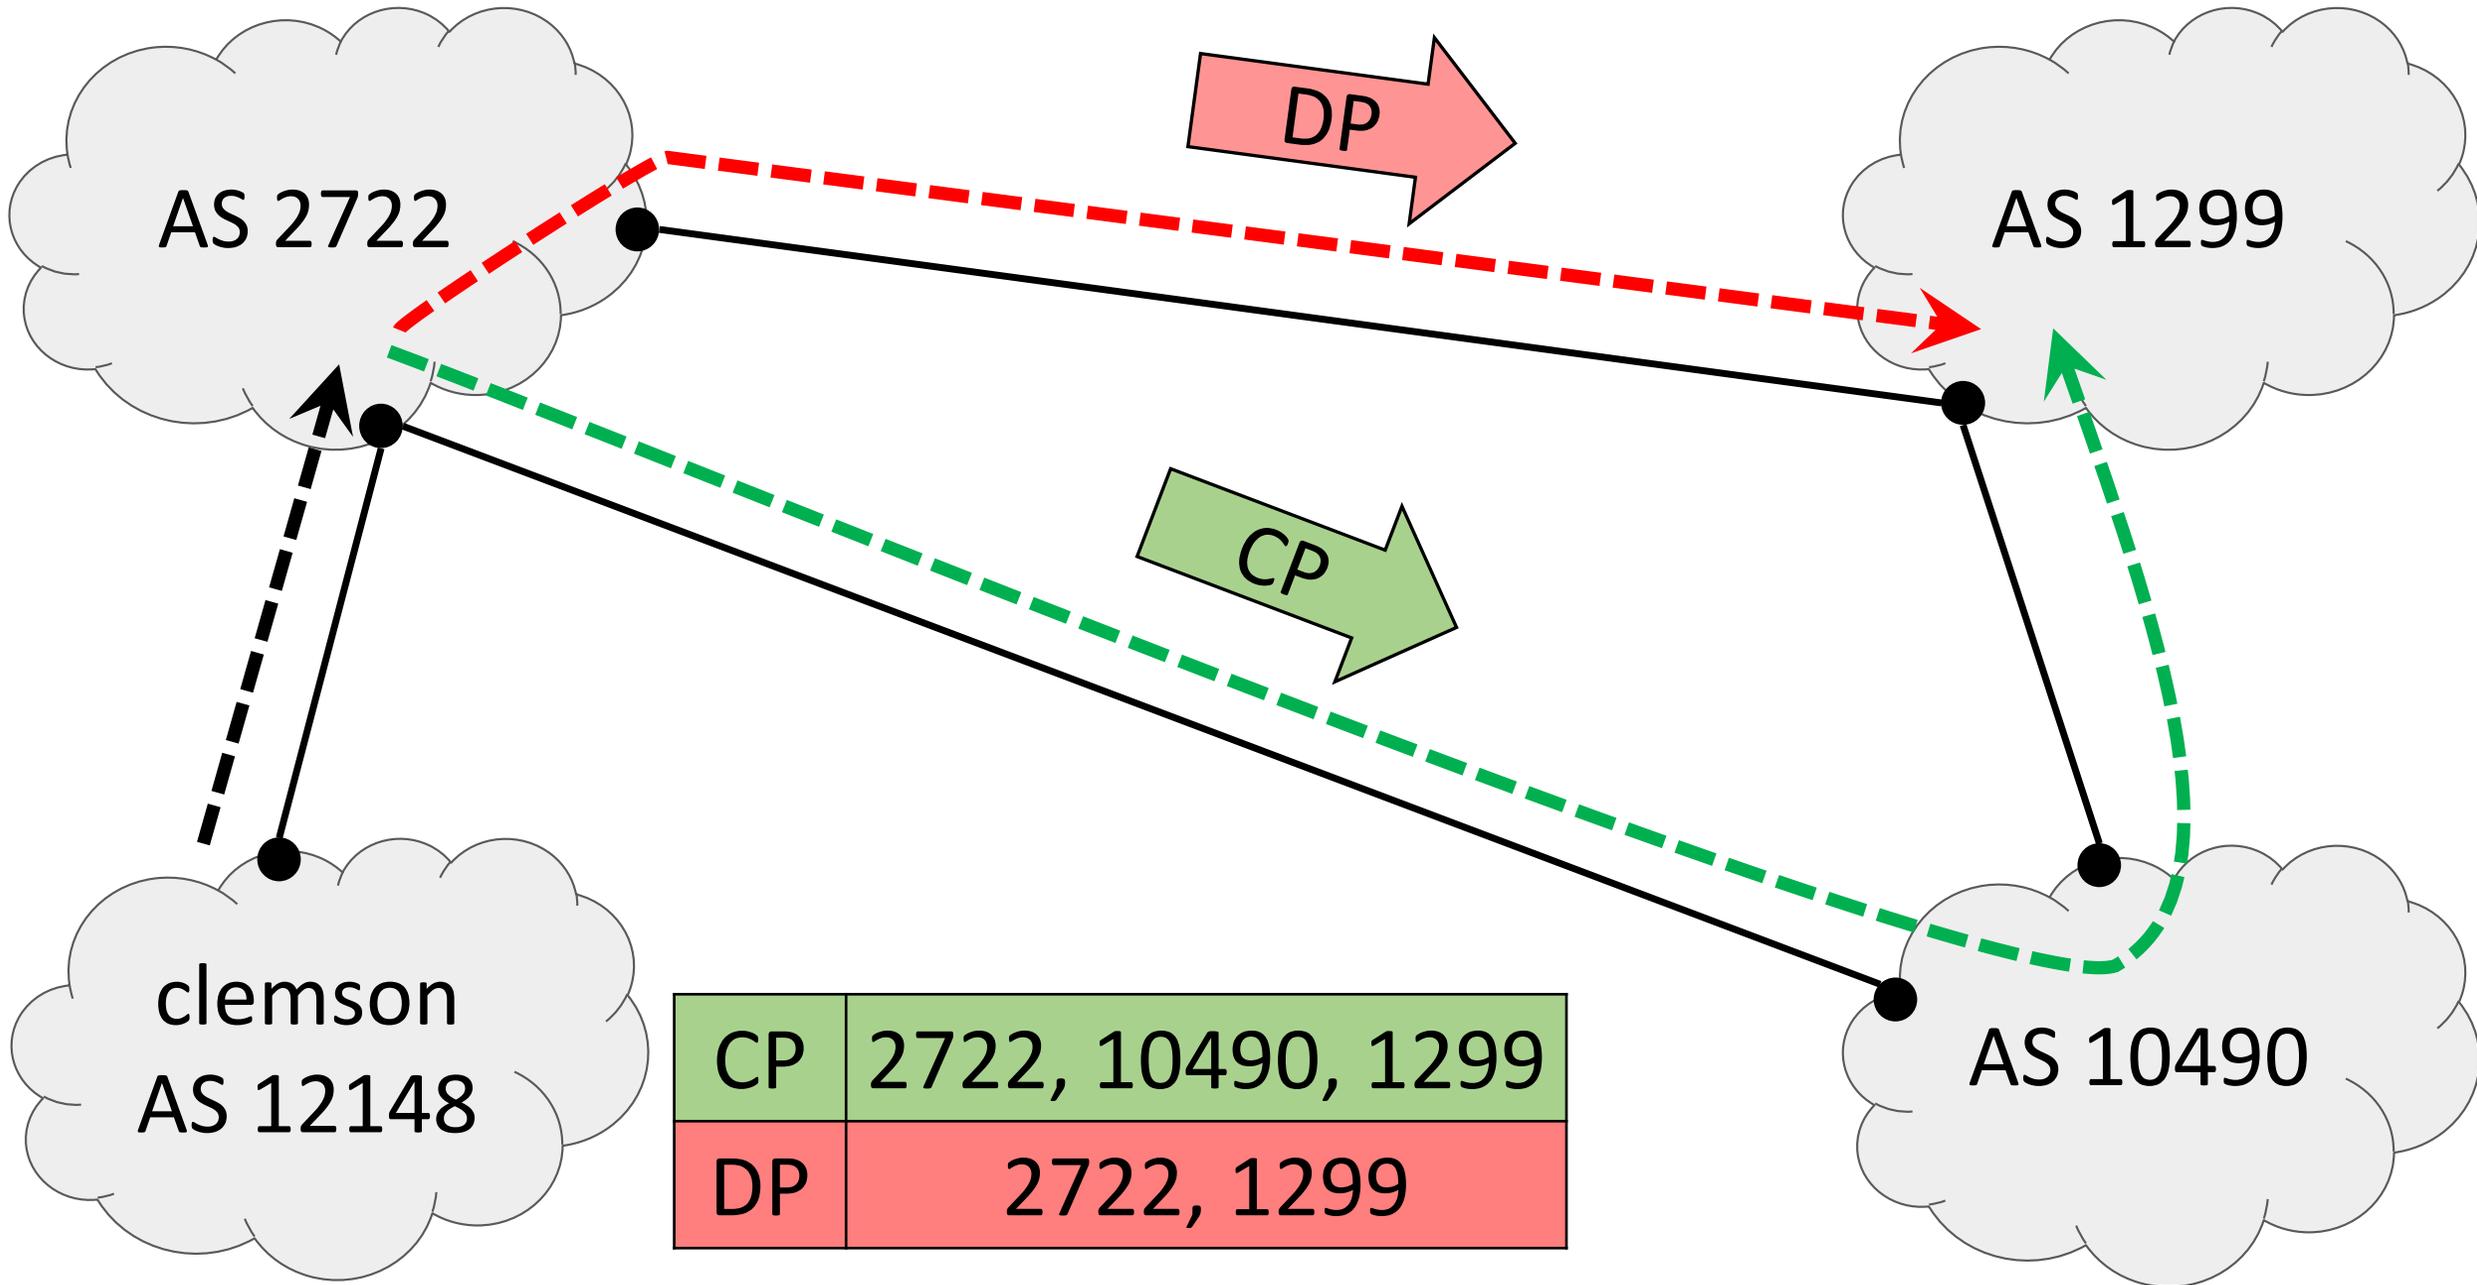

- Our framework allows to implement different noise-filtering models

Model/Rules	Mapping Relaxation			Wildcards Correction	
	SIB	looseTPA	strictTPA	match*	nomatch*
Raw	✗	✗	✗	✗	(i)
Upper	✗	✗	✗	(i)	(ii)
Restricted	(i)	✗	(ii)	(iii)	(iv)
Lower	(ii)	(i)	✗	(iii)	(iv)

# Mismatch (MM) rate in the wild

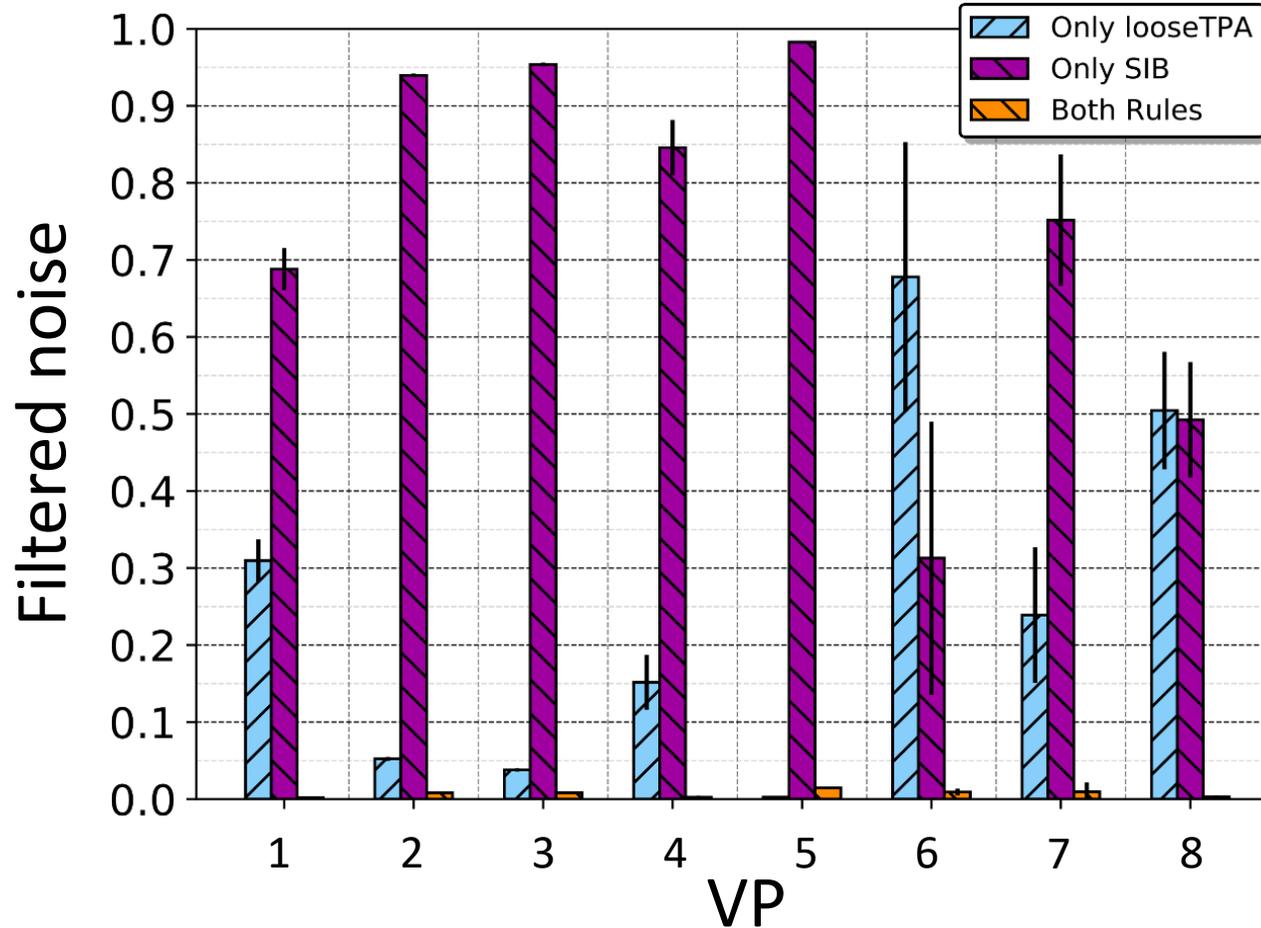

- The models implementing the mapping relaxation outperform the others
- The looseTPA does not outperform the strictTPA for much

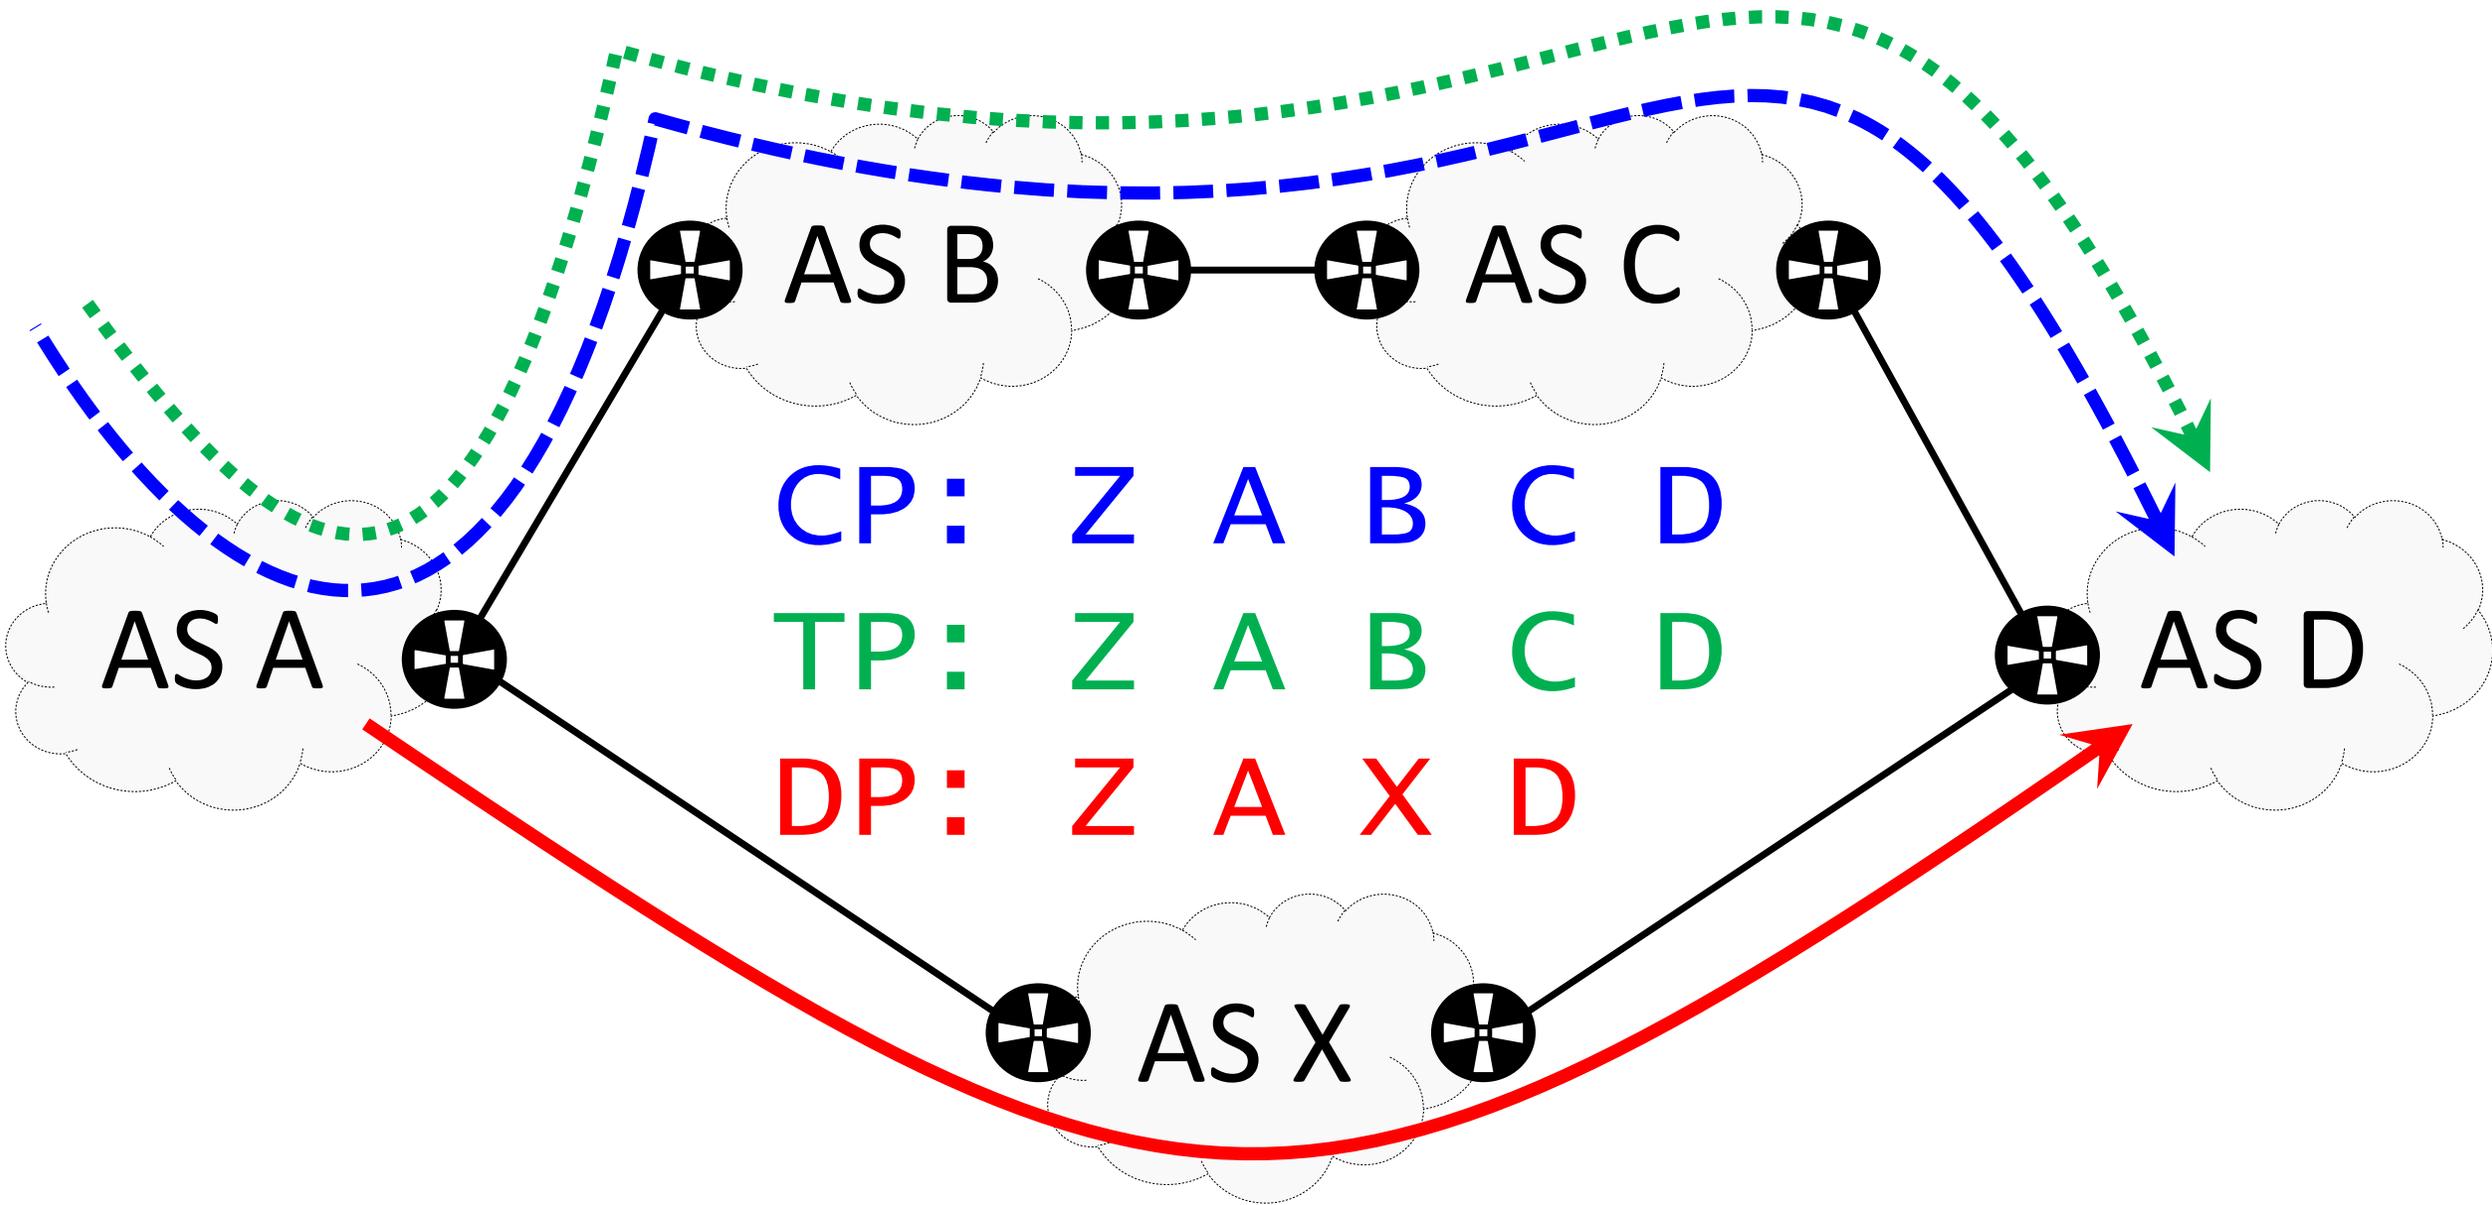

# Characterizing the mapping noise

# Looking at the filtered noise

- In general, AS siblings and third-party addresses not combine
- The worse source of noises varies depending on the VP

# DS-prevalence vs #members

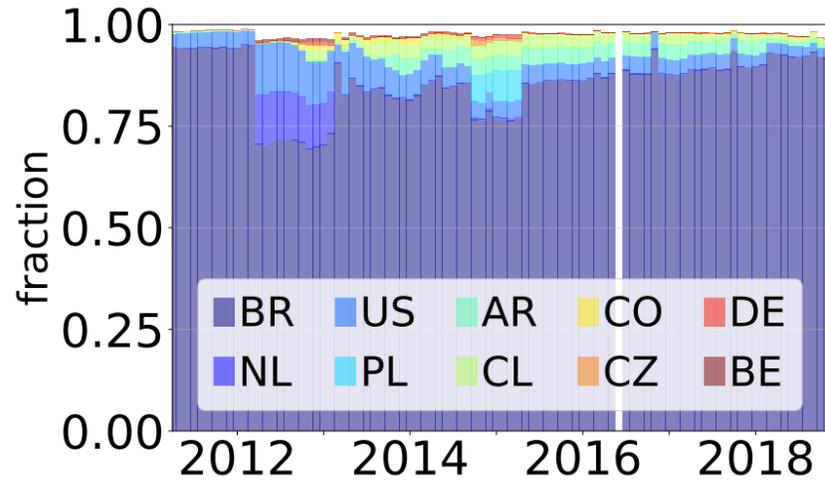

- IX.br-SP is the largest and the remaining in the TOP5 too
- IX.br is much larger than CABASE and PIT Chile
- Largest regional IXPs in cities that are economically central
- DS-prevalence if BR similar to DE, but AR and CL lower

# Visible ASes: domestic impact and foreign attraction

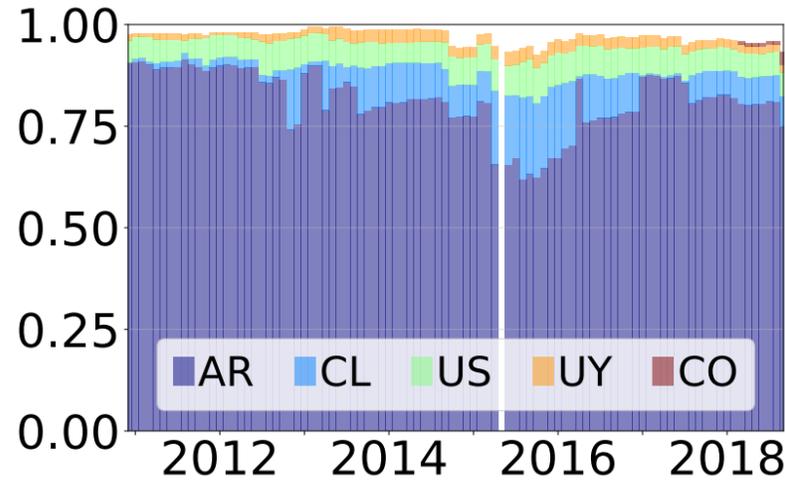

- Ratio of local visible ASes to all active ASes (with AS rels) in each country
- Lately, values in LatAm similar to those in Europe. Similar for Africa.
- PIT Chile is surprising given it's a "young" IXP, as BKNIX is also

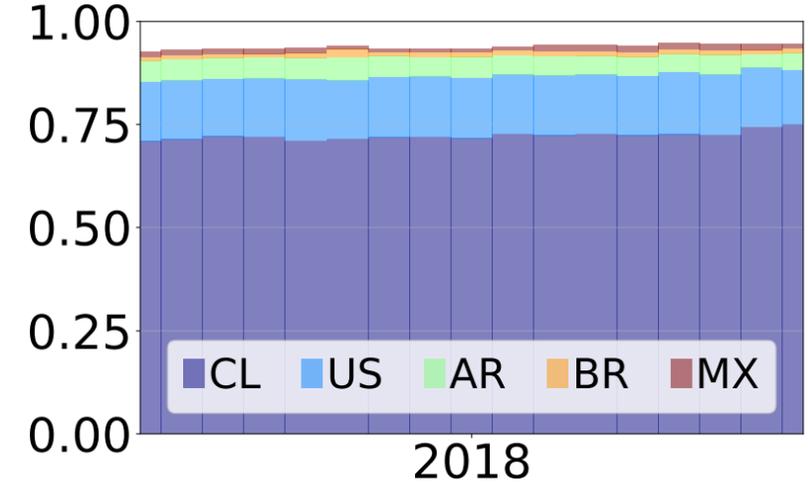

# Visible ASeS: foreign attraction

RI and FA

- **Forwarding Detour (FD)** – FA leading to a sub-optimal route

# Conclusions

- ❖ A forwarding model
- ❖ Two new concepts: Rles and FAs
- ❖ Two theorems:  $FDs \Rightarrow FAs \Rightarrow Rles$
- ❖ Observable FDs are a lower bound of Rles

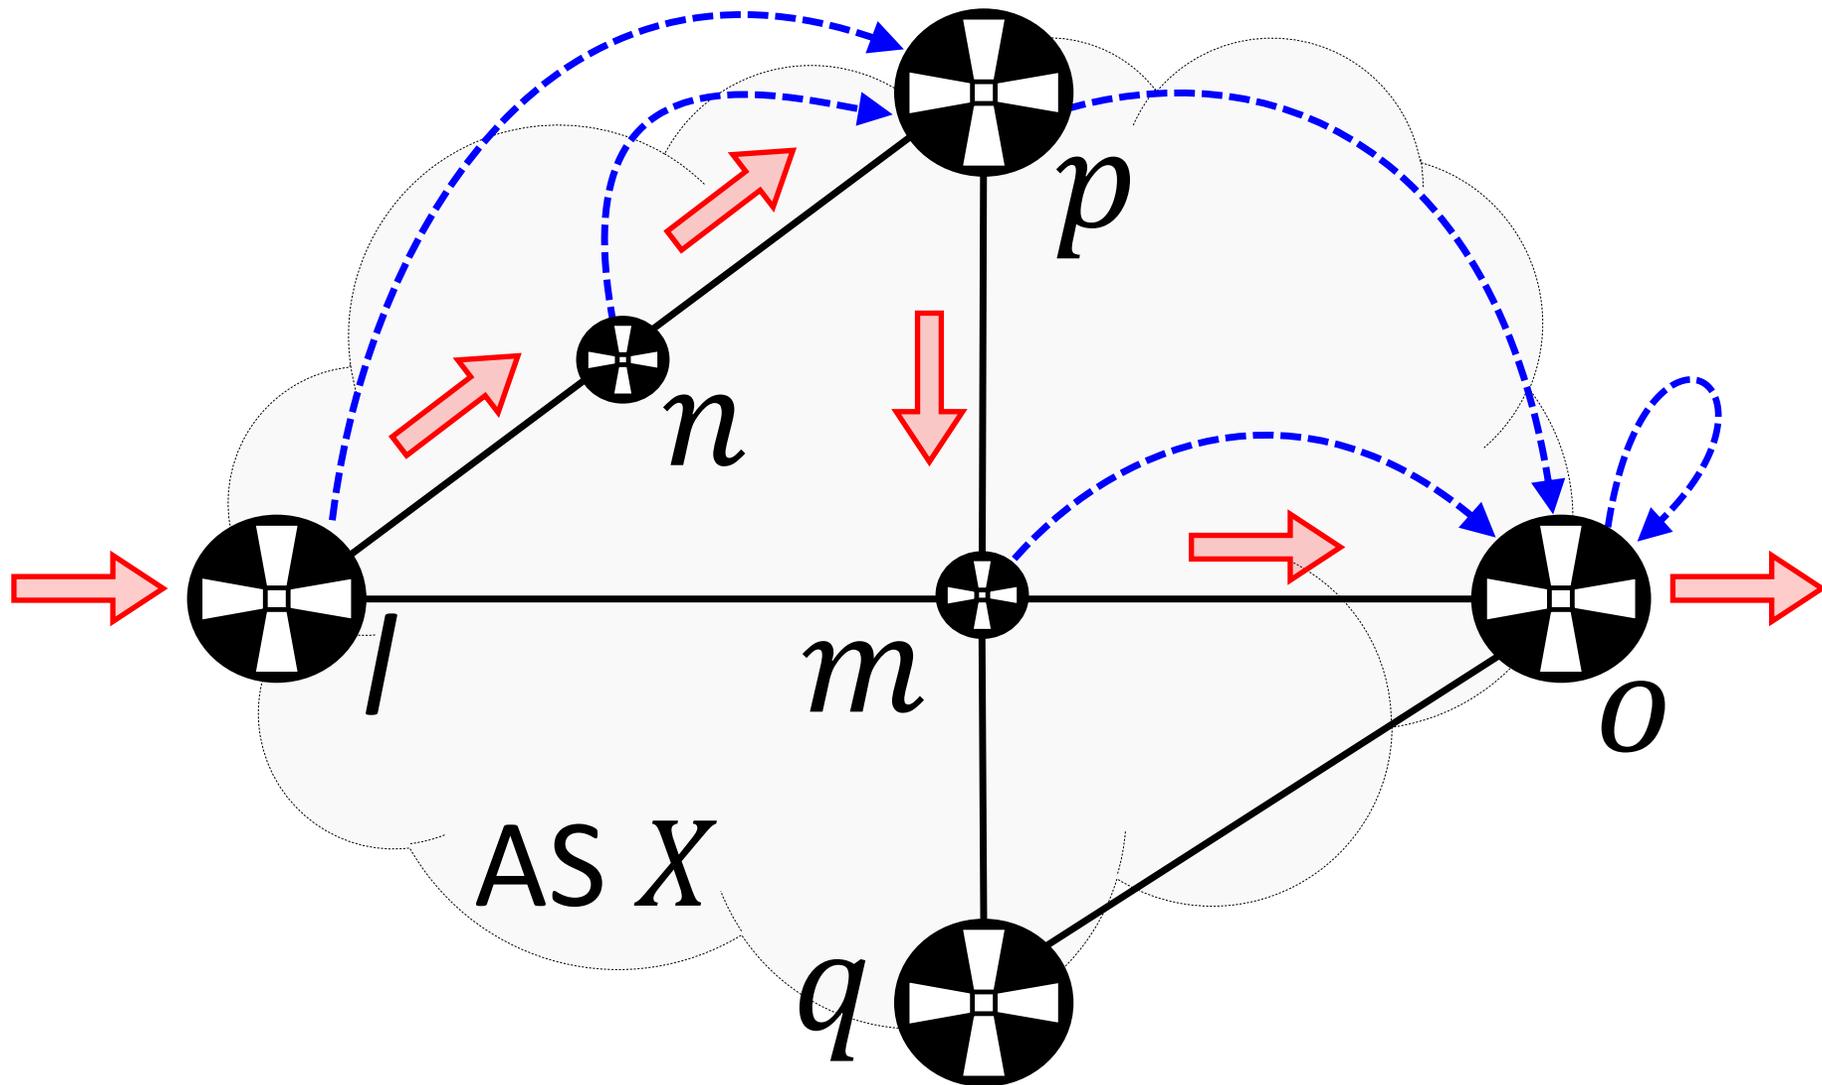

# Full-FIB vs Partial-FIB

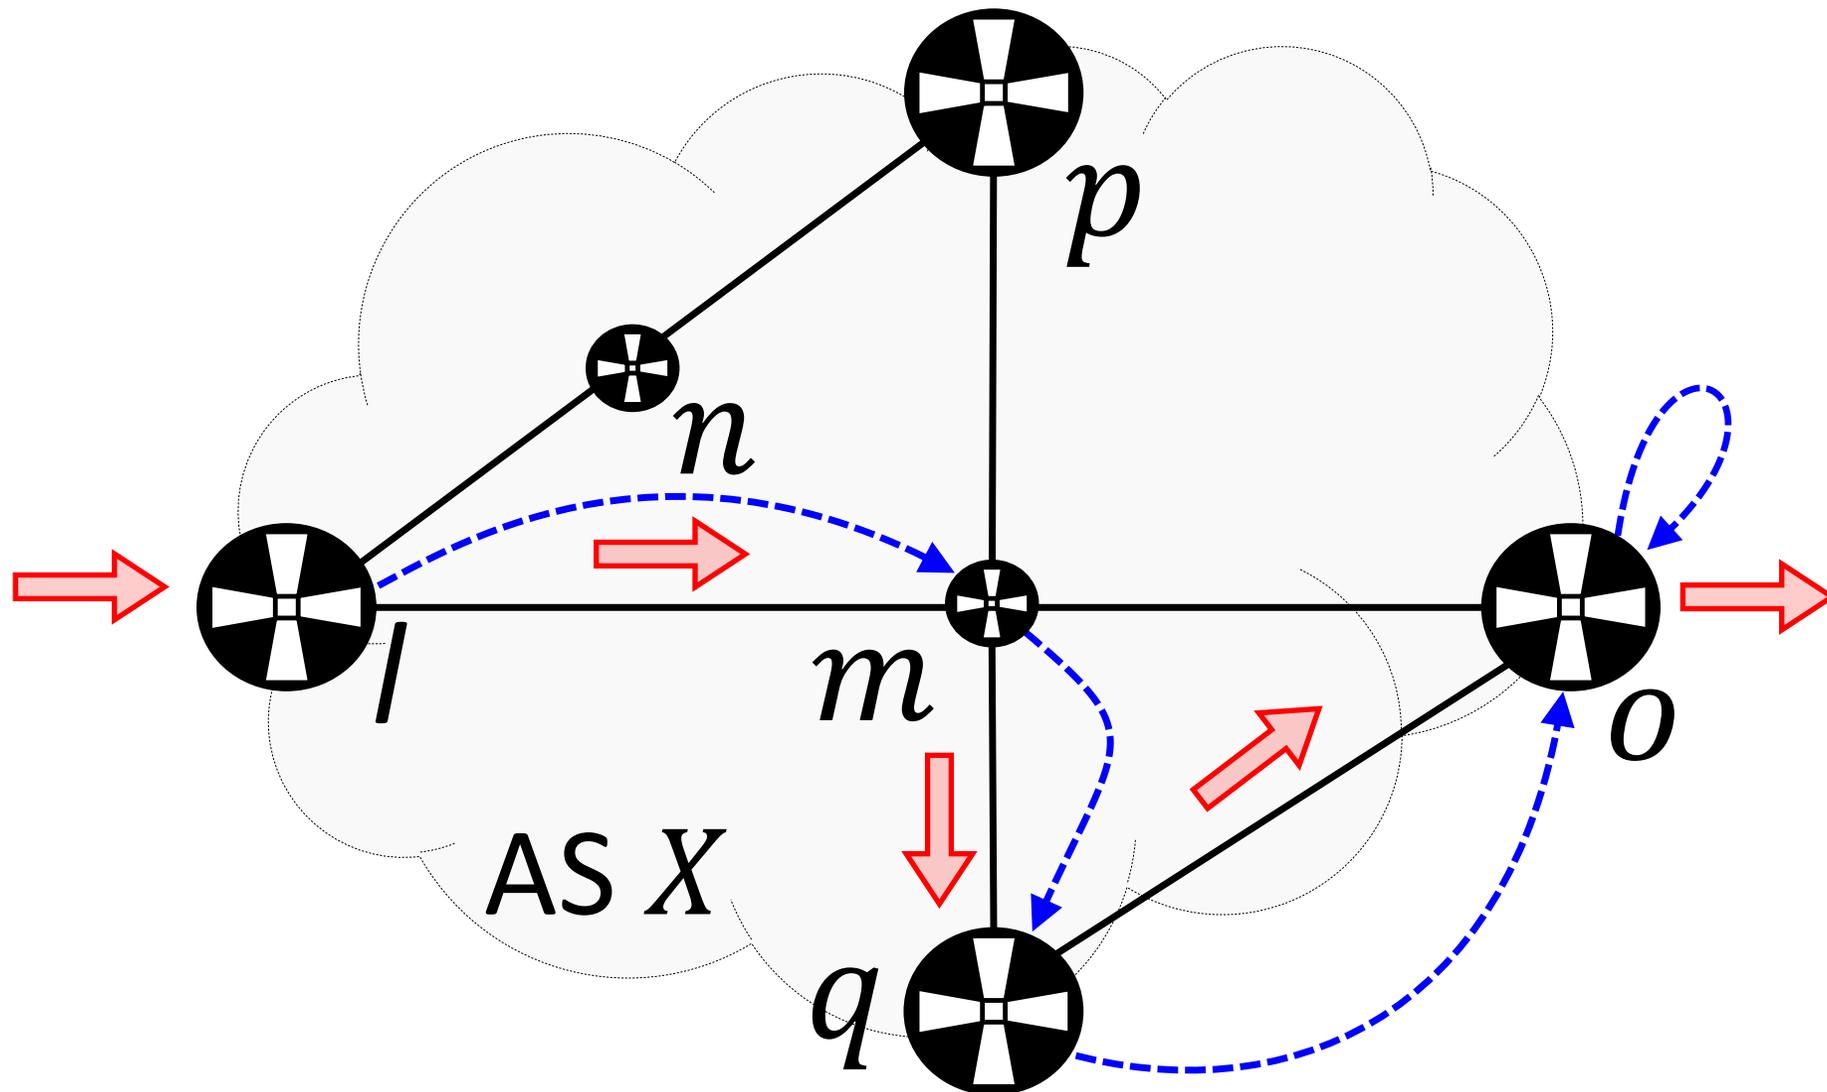

**FDs: may be a set of routes**

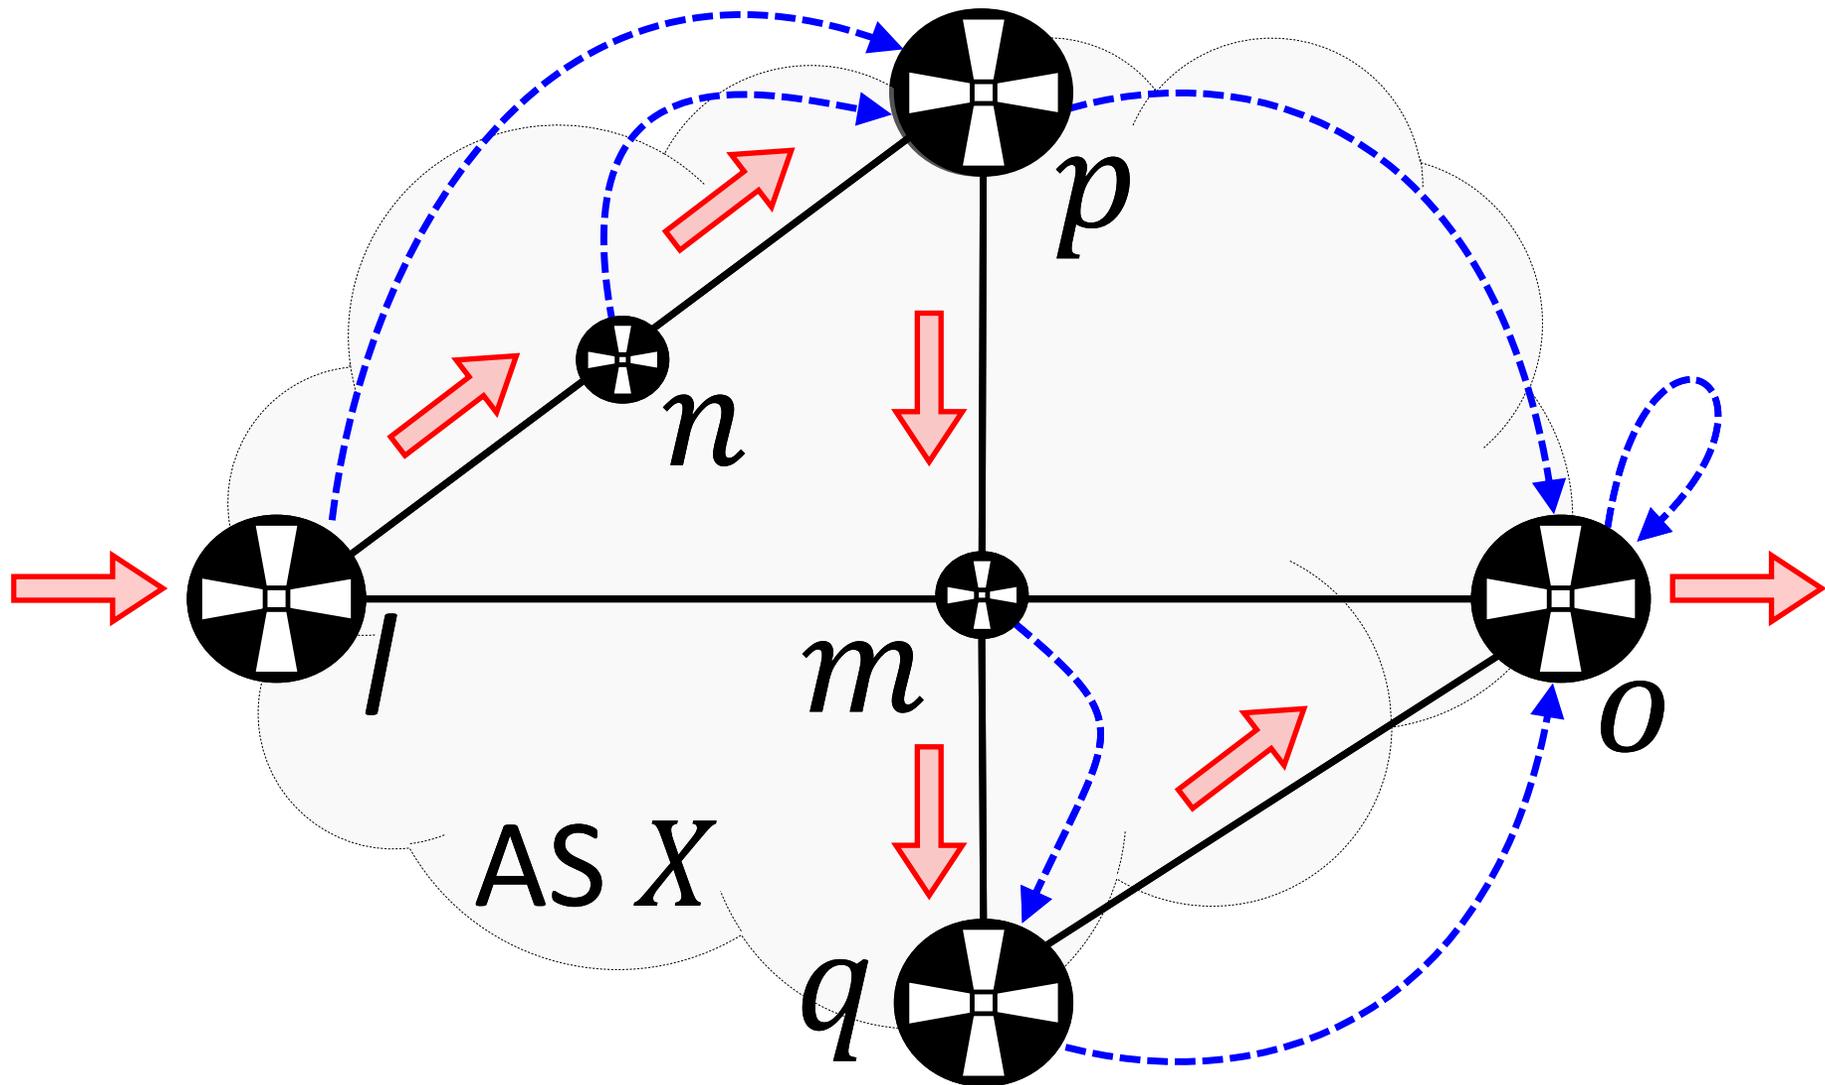

# Forwarding Detour I

# Forwarding Detour II

# Forwarding Detour III

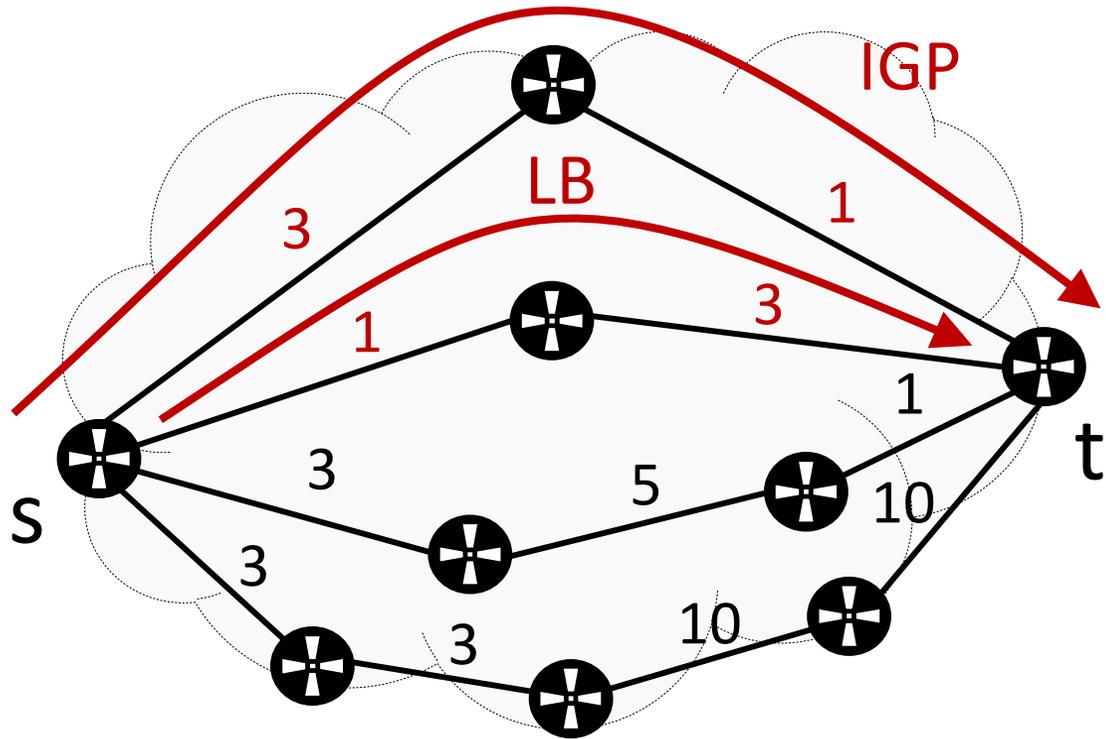

# **Load Balancing**

## **F-LB and C-LB**

# Load Balancing (LB)

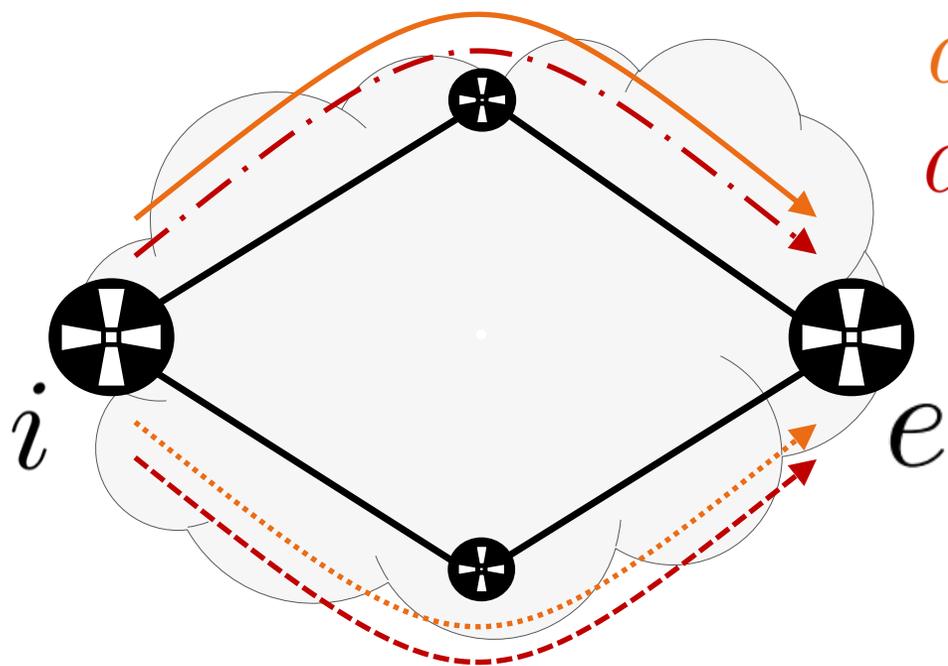

- There exist different LB flavors:
  - F-LB: different destination, then route may change
  - C-LB: same prefix, same route
